	Bibliography	465
	API Index	467

INTRODUCTION

The **MOSEK** Optimization Suite 8.0.0.94 is a powerful software package capable of solving large-scale optimization problems of the following kind:

- linear,
- convex quadratic,
- conic quadratic (also known as second-order cone),
- semidefinite,
- and general convex.

Integer constrained variables are supported for all problem classes except for semidefinite and general convex problems. In order to obtain an overview of features in the **MOSEK** Optimization Suite consult the [product introduction](#) guide.

1.1 Why the Optimizer API for C?

The Optimizer API for C provides low-level access to all functionalities of **MOSEK** from any C compatible language. It consists of a single header file and a set of library files which an application must link against when building. While the overhead of this interface is minimized, other interfaces might be considered more convenient to use for the project at hand.

1.2 License agreement

Before using the **MOSEK** software, please read the license agreement available in the distribution at <MSKHOME>/mosek/8/mosek-eula.pdf or on the **MOSEK** website <https://mosek.com/sales/license-agreement>.

MOSEK uses some third-party open-source libraries. Their license details follows.

zlib

MOSEK includes the *zlib* library obtained from the [zlib website](#). The license agreement for *zlib* is shown in [Listing 1.1](#).

Listing 1.1: *zlib* license.

```
zlib.h -- interface of the 'zlib' general purpose compression library
version 1.2.7, May 2nd, 2012

INSTALLATION

In this section we discuss how to install and setup the **MOSEK** Optimizer API for C.

Compability

The Optimizer API for C is compatible with the following compiler toolchains:

Platform	Supported compiler	Framework
Linux 64 bit	gcc (≥ 4.5)	glibc (≥ 2.2)
Mac OS 64 bit	Xcode (≥ 5)	MAC OS SDK (≥ 10.7)
Windows 32 and 64 bit	Visual Studio (≥ 2010)	

In many cases older versions can also be used.

Installing

Instructions for installing **MOSEK** Optimization Suite are located in the [Installation Guide](#).

Locating Files

The files in **MOSEK** Optimizer API for C are organized as reported in [Table 2.1](#).

Table 2.1: Relevant files for the **MOSEK** Optimizer API for C.

Relative Path	Description	Label
<MSKHOME>/mosek/8/tools/platform/<PLATFORM>/header	Header files	<HEADERDIR>
<MSKHOME>/mosek/8/tools/platform/<PLATFORM>/lib	Libraries and DLLs	<DLLDIR>, <LIBDIR>
<MSKHOME>/mosek/8/tools/examples/c	Examples	<EXDIR>
<MSKHOME>/mosek/8/tools/examples/data	Additional data	<MISCDIR>

2.1 Testing the Installation and Compiling Examples

This section describes how to verify that **MOSEK** has been installed correctly, and how to build and execute the C examples distributed with **MOSEK**.

2.1.1 Windows

Compiling examples using NMake

The example directory contains makefiles for use with Microsoft NMake. These make files requires that the Visual Studio tool chain is setup. Usually, the submenu containing Visual Studio also contains a Visual Studio *Command Prompt* which does the necessary setup.

To build the examples, open a DOS box and change directory to <EXDIR>. This directory contains a makefile named **Makefile**. To compile all examples, run the command

```
nmake /f Makefile all
```

To build only a single example instead of all examples, replace **all** by the corresponding executable name. For example, to build **lo1.exe** type

```
nmake /f Makefile lo1.exe
```

Compiling from command line

To compile and run a C example using the **MOSEK** dll, the following files are required:

- The header file **mosek.h** defining all functions and constants in **MOSEK**
- The **MOSEK** solver lib: **mosek64_8_0.lib** on 64-bit Microsoft Windows, or **mosek32_8_0.lib** on 32-bit Microsoft Windows.
- The **MOSEK** solver dll: **mosek64_8_0.dll** on 64-bit Microsoft Windows or **mosek32_8_0.dll** on 32-bit Microsoft Windows

To compile and execute the distributed example **lo1.c**, do the following:

1. Compile the example into an executable **lo1.exe** (we assume that the Visual Studio C compiler **cl.exe** is available). For 64-bit Windows:

```
cl <EXDIR>\lo1.c /I <HEADERDIR> /link <LIBDIR>\mosek64_8_0.lib
```

2. To run the compiled examples, enter

```
.\lo1.exe
```

Adding MOSEK to a Visual Studio Project

The following walk-through is specific for Microsoft Visual Studio 2012, but may work for other versions too. To compile a project linking to **MOSEK** in Visual Studio, the following steps are necessary:

1. Create a project or open an existing project in Visual Studio.
2. In the **Solution Explorer** right-click on the relevant project and select **Properties**. This will open the **Property pages** dialog.
3. In the selection box **Configuration:** select **All Configurations**.
4. In the tree-view open **Configuration Properties** → **C/C++** → **General**.
5. In the properties click the **Additional Include Directories** field and select edit.
6. Click on the **New Folder** button and write the *full path* to the **h** header file or browse for the file. For example, for 64-bit Windows use <HEADERDIR>.
7. Click **OK**.

8. Back in the **Property Pages** dialog select from the tree-view **Configuration Properties** → **Linker** → **Input**.
9. In the properties view click in the **Additional Dependencies** field and select edit. This will open the **Additional Dependencies** dialog.
10. Add the full path of the **MOSEK** lib. For example, for 64-bit Windows:
`<LIBDIR>\mosek64_8_0.lib`
11. Click **OK**.
12. Back in the **Property Pages** dialog click **OK**.

If you have selected to link with the 64 bit version of **MOSEK** you must also target the 64-bit platform. To do this follow the steps below:

1. Open the **property pages** for that project.
2. Click **Configuration Manager** to open the Configuration Manager Dialog Box.
3. Click the **Active Solution Platform** list, and then select the **New** option to open the New Solution Platform Dialog Box.
4. Click the Type or select the new platform drop-down arrow, and then select the x64 platform.
5. Click **OK**. The platform you selected in the preceding step will appear under Active Solution Platform in the Configuration Manager dialog box.

2.1.2 Mac OS and Linux

Compiling examples using GNU Make

The example directory contains makefiles for use with GNU Make.

To build the examples, open a prompt and change directory to the examples directory

```
<EXDIR>/c
```

The directory contains a makefile for GNU Make and gcc. To build all examples, go to the examples and enter

```
make -f Makefile all
```

To build one example instead of all examples, replace **all** by the corresponding executable name. For example, to build the **lo1** executable type

```
make -f Makefile lo1
```

The **Makefile** demonstrates how to compile using GNU C. To compile **lo1.c** not only the correct path (**HEADERDIR**) to the header and the library (**LIBDIR**) must be set, but also the relevant libraries must be linked, i.e. **-lmosek** on 32bit or **-lmosek64** on 64bit machines. Please consult the make file for details.

BASIC TUTORIALS

In this section a number of examples is provided to demonstrate the functionality required for solving linear, conic, semidefinite and quadratic problems as well as mixed integer problems.

- *Basic tutorial* : This is the simplest tutorial: it solves a linear optimization problem read from file. It will show how
 - setup the **MOSEK** environment and problem task,
 - run the solver and
 - check the optimization results.
- *Linear optimization tutorial* : It shows how to input a linear program. It will show how
 - define variables and their bounds,
 - define constraints and their bounds,
 - define a linear objective function,
 - input a linear program but rows or by column.
 - retrieve the solution.
- *Conic quadratic optimization tutorial* : The basic steps needed to formulate a conic quadratic program are introduced:
 - define quadratic cones,
 - assign the relevant variables to their cones.
- *Semidefinite optimization tutorial* : How to input semidefinite optimization problems is the topic of this tutorial, and in particular how to
 - input semidefinite matrices and in sparse format,
 - add semidefinite matrix variable and
 - formulate linear constraints and objective function based on matrix variables.
- *Mixed-Integer optimization tutorial* : This tutorial shows how integrality conditions can be specified.
- *Quadratic optimization tutorial* : It shows how to input quadratic terms in the objective function and constraints.
- *Response code tutorial* : How to deal with the termination and solver status code is the topic of this tutorial:
 - what are termination and termination code,
 - how to check for errors and
 - which are the best practice to deal with them.

This is a very important tutorial, every user should go through it.

- *Reoptimization tutorial* : This tutorial gives information on how to

- modify linear constraints,
- add new variables/constraints and
- reoptimize the given problem, i.e. run the **MOSEK** optimizer again.
- *Solution analysis* : This tutorial shows how the user can analyze the solution returned by the solver.
- *Parameter setting tutorial* : This tutorial shows how to set the solver parameters.

3.1 The Basics Tutorial

The simplest program using the **MOSEK** C interface can be described shortly:

1. Create an environment.
2. Set up environment specific data and initialize the environment.
3. Create a task.
4. Load a problem into the task.
5. Optimize the problem.
6. Fetch the result.
7. Delete the environment and task.

3.1.1 The environment and the task

The first **MOSEK** related step in any program that employs **MOSEK** is to create an environment object. The environment contains environment specific data such as information about the license file, streams for environment messages etc. When this is done one or more task objects can be created. Each task is associated with a single environment and defines a complete optimization problem as well as task message streams and optimization parameters.

In C, the creation of an environment and a task would look something like this:

```
MSKenv_t env = NULL;
MSKtask_t task = NULL;
MSKrescode_e res;

/* Create an environment */
res = MSK_makeenv(&env, NULL);

/* Create a task */
if (res == MSK_RES_OK)
    res = MSK_maketask(env, 0,0, &task);

/* Load a problem into the task, optimize etc. */

MSK_deletetask(&task);
MSK_deleteenv(&env);
```

Please note that multiple tasks should, if possible, share the same environment.

3.1.2 Example: Simple Working Example

The simple example in [Listing 3.1](#) shows a working C program which

- creates an environment and a task,

- reads a problem from a file,
- optimizes the problem, and
- writes the solution to a file.

Listing 3.1: A simple code solving a problem loaded from file.

```
#include "mosek.h"

static void MSKAPI printstr(void *handle, const char str[])
{
    printf("%s",str);
}

int main (int argc, const char * argv[])
{
    MSKenv_t    env = NULL;
    MSKtask_t   task = NULL;
    MSKrescodee res = MSK_RES_OK;

    if (argc <= 1)
    {
        printf ("Missing argument, syntax is:\n");
        printf ("  simple inputfile [ solutionfile ]\n");
    }
    else
    {
        // Create the mosek environment.
        // The 'NULL' arguments here, are used to specify customized
        // memory allocators and a memory debug file. These can
        // safely be ignored for now.
        res = MSK_makeenv (&env,NULL);

        // Create a task object linked with the environment env.
        // We create it with 0 variables and 0 constraints initially,
        // since we do not know the size of the problem.
        if ( res==MSK_RES_OK )
            res = MSK_maketask (env, 0, 0, &task);

        // Direct the task log stream to a user specified function
        if ( res==MSK_RES_OK )
            res = MSK_linkfunctotaskstream (task, MSK_STREAM_LOG, NULL, printstr);

        // We assume that a problem file was given as the first command
        // line argument (received in 'argv')
        if ( res==MSK_RES_OK )
            res = MSK_readdata (task, argv[1]);

        // Solve the problem
        if ( res==MSK_RES_OK )
            res = MSK_optimize (task);

        // Print a summary of the solution.
        if ( res==MSK_RES_OK )
            res = MSK_solutionsummary (task, MSK_STREAM_LOG);

        // If an output file was specified, write a solution
        if ( res==MSK_RES_OK && argc >= 3 )
        {
            // We define the output format to be OPF, and tell MOSEK to
            // leave out parameters and problem data from the output file.
            MSK_putintparam (task, MSK_IPAR_WRITE_DATA_FORMAT,    MSK_DATA_FORMAT_OP);
            MSK_putintparam (task, MSK_IPAR_OPF_WRITE_SOLUTIONS,  MSK_ON);
        }
    }
}
```

```
MSK_putintparam (task, MSK_IPAR_OPF_WRITE_HINTS,      MSK_OFF);
MSK_putintparam (task, MSK_IPAR_OPF_WRITE_PARAMETERS, MSK_OFF);
MSK_putintparam (task, MSK_IPAR_OPF_WRITE_PROBLEM,    MSK_OFF);

res = MSK_writedata (task, argv[2]);
}

// Delete task and environment
MSK_deletetask (&task);
MSK_deleteenv (&env);
}
return res;
}
```

Reading and Writing Problems

Use the *task.writedata* function to write a problem to a file. By default, when not choosing any specific file format for the parameter *MSK_IPAR_WRITE_DATA_FORMAT*, **MOSEK** will determine the output file format by the extension of the file name:

```
res = MSK_writedata (task, argv[2]);
```

Similarly, controlled by *MSK_IPAR_READ_DATA_FORMAT*, the function *task.readdata* can read a problem from a file:

```
res = MSK_readdata (task, argv[1]);
```

Working with the problem data

An optimization problem consists of several components; objective, objective sense, constraints, variable bounds etc.

Therefore, the interface provides a number of methods to operate on the task specific data, all of which are listed in Section 16.

Setting parameters

Apart from the problem data, the task contains a number of parameters defining the behavior of **MOSEK**. For example the *MSK_IPAR_OPTIMIZER* parameter defines which optimizer to use. There are three kinds of parameters in **MOSEK**

- Integer parameters that can be set with *task.putintparam*,
- Double parameters that can be set with *task.putdouparam*, and
- string parameters that can be set with *task.putstrparam*,

The values for integer parameters are either simple integer values or enum values. See Section 3.10 for more details on how to set parameters.

A complete list of all parameters is found in Section 16.4.

3.2 Linear Optimization

The simplest optimization problem is a purely linear problem. A *linear optimization problem* is a problem of the following form:

Minimize or maximize the objective function

$$\sum_{j=0}^{n-1} c_j x_j + c^f$$

subject to the linear constraints

$$l_k^c \leq \sum_{j=0}^{n-1} a_{kj} x_j \leq u_k^c, \quad k = 0, \dots, m-1,$$

and the bounds

$$l_j^x \leq x_j \leq u_j^x, \quad j = 0, \dots, n-1,$$

where we have used the problem elements:

- m and n which are the number of constraints and variables respectively,
- x which is the variable vector of length n ,
- c which is a coefficient vector of size n

$$c = \begin{bmatrix} c_0 \\ \vdots \\ c_{n-1} \end{bmatrix},$$

- c^f which is a constant,
- A which is a $m \times n$ matrix of coefficients is given by

$$A = \begin{bmatrix} a_{0,0} & \cdots & a_{0,(n-1)} \\ \vdots & \cdots & \vdots \\ a_{(m-1),0} & \cdots & a_{(m-1),(n-1)} \end{bmatrix},$$

- l^c and u^c which specify the lower and upper bounds on constraints respectively, and
- l^x and u^x which specifies the lower and upper bounds on variables respectively.

Note: Please note the unconventional notation using 0 as the first index rather than 1. Hence, x_0 is the first element in variable vector x .

3.2.1 Example LO1

The following is an example of a linear optimization problem:

$$\begin{array}{llllll} \text{maximize} & 3x_0 & + & 1x_1 & + & 5x_2 & + & 1x_3 \\ \text{subject to} & 3x_0 & + & 1x_1 & + & 2x_2 & & = & 30, \\ & 2x_0 & + & 1x_1 & + & 3x_2 & + & 1x_3 & \geq & 15, \\ & & & 2x_1 & & & + & 3x_3 & \leq & 25, \end{array} \quad (3.1)$$

having the bounds

$$\begin{array}{llll} 0 & \leq & x_0 & \leq & \infty, \\ 0 & \leq & x_1 & \leq & 10, \\ 0 & \leq & x_2 & \leq & \infty, \\ 0 & \leq & x_3 & \leq & \infty. \end{array}$$

Solving the problem

To solve the problem above we go through the following steps:

1. Create an environment.
2. Create an optimization task.
3. Load a problem into the task object.
4. Optimization.
5. Extracting the solution.

Below we explain each of these steps.

Create an environment.

Before setting up the optimization problem, a **MOSEK** environment must be created. All tasks in the program should share the same environment.

```
r = MSK_makeenv(&env,NULL);
```

Create an optimization task.

Next, an empty task object is created:

```
/* Create the optimization task. */
r = MSK_maketask(env,numcon,numvar,&task);

/* Directs the log task stream to the 'printstr' function. */
if ( r==MSK_RES_OK )
    r = MSK_linkfunctotaskstream(task,MSK_STREAM_LOG,NULL,printstr);
```

We also connect a call-back function to the task log stream. Messages related to the task are passed to the call-back function. In this case the stream call-back function writes its messages to the standard output stream.

Load a problem into the task object.

Before any problem data can be set, variables and constraints must be added to the problem via calls to the functions `task.appendcons` and `task.appendvars`.

```
/* Append 'numcon' empty constraints.
The constraints will initially have no bounds. */
if ( r == MSK_RES_OK )
    r = MSK_appendcons(task,numcon);

/* Append 'numvar' variables.
The variables will initially be fixed at zero (x=0). */
if ( r == MSK_RES_OK )
    r = MSK_appendvars(task,numvar);
```

New variables can now be referenced from other functions with indexes in $0, \dots, \text{numvar} - 1$ and new constraints can be referenced with indexes in $0, \dots, \text{numcon} - 1$. More variables and/or constraints can be appended later as needed, these will be assigned indexes from $\text{numvar}/\text{numcon}$ and up.

Next step is to set the problem data. We loop over each variable index $j = 0, \dots, \text{numvar} - 1$ calling functions to set problem data. We first set the objective coefficient $c_j = c[j]$ by calling the function `task.putcj`.

```

/* Set the linear term c_j in the objective.*/
if(r == MSK_RES_OK)
    r = MSK_putcj(task, j, c[j]);

```

The bounds on variables are stored in the arrays

```

const MSKboundkeye bkg[] = {MSK_BK_LO,      MSK_BK_RA, MSK_BK_LO,      MSK_BK_LO      };
const double       blx[] = {0.0,           0.0,      0.0,           0.0           };
const double       bux[] = {+MSK_INFINITY, 10.0,      +MSK_INFINITY, +MSK_INFINITY };

```

and are set with calls to `task.putvarbound`.

```

/* Set the bounds on variable j.
   blx[j] <= x_j <= bux[j] */
if(r == MSK_RES_OK)
    r = MSK_putvarbound(task,
                        j,          /* Index of variable.*/
                        bkg[j],    /* Bound key.*/
                        blx[j],    /* Numerical value of lower bound.*/
                        bux[j]);  /* Numerical value of upper bound.*/

```

The *Bound key* stored in `bkg` specify the type of the bound according to Table 3.1.

Table 3.1: Bound keys as defined in the enum `MSKboundkeye`.

Bound key	Type of bound	Lower bound	Upper bound
<code>MSK_BK_FX</code>	$u_j = l_j$	Finite	Identical to the lower bound
<code>MSK_BK_FR</code>	Free	$-\infty$	$+\infty$
<code>MSK_BK_LO</code>	$l_j \leq \dots$	Finite	$+\infty$
<code>MSK_BK_RA</code>	$l_j \leq \dots \leq u_j$	Finite	Finite
<code>MSK_BK_UP</code>	$\dots \leq u_j$	$-\infty$	Finite

Interpretation of the bound keys.

For instance `bkg[0] = MSK_BK_LO` means that $x_0 \geq l_0^x$. Finally, the numerical values of the bounds on variables are given by

$$l_j^x = \text{blx}[j]$$

and

$$u_j^x = \text{bux}[j].$$

Recall that in our example the A matrix is given by

$$A = \begin{bmatrix} 3 & 1 & 2 & 0 \\ 2 & 1 & 3 & 1 \\ 0 & 2 & 0 & 3 \end{bmatrix}.$$

This matrix is stored in sparse format in the arrays:

```

const MSKint32t  aptrb[] = {0, 2, 5, 7},
                 aptre[] = {2, 5, 7, 9},
                 asub[]  = { 0, 1,
                           0, 1, 2,
                           0, 1,
                           1, 2};
const double     aval[]  = { 3.0, 2.0,
                           1.0, 1.0, 2.0,
                           2.0, 3.0,
                           1.0, 3.0};

```

The `ptrb`, `ptre`, `asub`, and `aval` arguments define the constraint matrix A in the column ordered sparse format (for details, see Section 16.1.3.2).

Using the function `task.putacol` we set column j of A

```
r = MSK_putacol(task,
                j, /* Variable (column) index.*/
                aptre[j]-aptrb[j], /* Number of non-zeros in column j.*/
                asub+aptrb[j], /* Pointer to row indexes of column j.*/
                aval+aptrb[j]); /* Pointer to Values of column j.*/
```

Alternatively, the same A matrix can be set one row at a time; please see Listing 3.3.

Finally, the bounds on each constraint are set by looping over each constraint index $i = 0, \dots, \text{numcon} - 1$

```
/* Set the bounds on constraints.
   for i=1, ..., numcon : blc[i] <= constraint i <= buc[i] */
for(i=0; i<numcon && r==MSK_RES_OK; ++i)
    r = MSK_putconbound(task,
                        i, /* Index of constraint.*/
                        bkc[i], /* Bound key.*/
                        blc[i], /* Numerical value of lower bound.*/
                        buc[i]); /* Numerical value of upper bound.*/
```

Optimization

After the problem is set-up the task can be optimized by calling the function `task.optimize`.

```
r = MSK_optimizetrm(task, &trmcode);
```

Extracting the solution.

After optimizing the status of the solution is examined with a call to `task.getsolsta`. If the solution status is reported as `MSK_SOL_STA_OPTIMAL` or `MSK_SOL_STA_NEAR_OPTIMAL` the solution is extracted in the lines below:

```
MSK_getxx(task,
          MSK_SOL_BAS, /* Request the basic solution. */
          xx);
```

The `task.getxx` function obtains the solution. **MOSEK** may compute several solutions depending on the optimizer employed. In this example the *basic solution* is requested by setting the first argument to `MSK_SOL_BAS`.

                   desc);
}

```

```

    printf("Error %s - '%s'\n", symname, desc);
}

/* Delete the task and the associated data. */
MSK_deletetask(&task);
}

/* Delete the environment and the associated data. */
MSK_deleteenv(&env);

return r;
}

```

3.3 Conic Quadratic Optimization

Conic optimization is a generalization of linear optimization, allowing constraints of the type

$$x^t \in \mathcal{K}_t,$$

where x^t is a subset of the problem variables and \mathcal{K}_t is a convex cone. Actually, since the set \mathbb{R}^n of real numbers is also a convex cone, all variables can in fact be partitioned into subsets belonging to separate convex cones, simply stated $x \in \mathcal{K}$.

MOSEK can solve conic quadratic optimization problems of the form

$$\begin{array}{ll}
 \text{minimize} & c^T x + c^f \\
 \text{subject to} & l^c \leq Ax \leq u^c, \\
 & l^x \leq x \leq u^x, \\
 & x \in \mathcal{K},
 \end{array}$$

where the domain restriction, $x \in \mathcal{K}$, implies that all variables are partitioned into convex cones

$$x = (x^0, x^1, \dots, x^{p-1}), \quad \text{with } x^t \in \mathcal{K}_t \subseteq \mathbb{R}^{n_t}.$$

For convenience, the user only specify subsets of variables x^t belonging to cones \mathcal{K}_t different from the set \mathbb{R}^{n_t} of real numbers. These cones can be a:

- Quadratic cone:

$$\mathcal{Q}^n = \left\{ x \in \mathbb{R}^n : x_0 \geq \sqrt{\sum_{j=1}^{n-1} x_j^2} \right\}.$$

- Rotated quadratic cone:

$$\mathcal{Q}_r^n = \left\{ x \in \mathbb{R}^n : 2x_0x_1 \geq \sum_{j=2}^{n-1} x_j^2, \quad x_0 \geq 0, \quad x_1 \geq 0 \right\}.$$

From these definition it follows that

$$(x_4, x_0, x_2) \in \mathcal{Q}^3,$$

is equivalent to

$$x_4 \geq \sqrt{x_0^2 + x_2^2}.$$

Furthermore, each variable may belong to one cone at most. The constraint $x_i - x_j = 0$ would however allow x_i and x_j to belong to different cones with same effect.

3.3.1 Example CQO1

We want to solve the following Conic Optimization Problem problem:

$$\begin{aligned}
 & \text{minimize} && x_4 + x_5 + x_6 \\
 & \text{subject to} && x_1 + x_2 + 2x_3 = 1, \\
 & && x_1, x_2, x_3 \geq 0, \\
 & && x_4 \geq \sqrt{x_1^2 + x_2^2}, \\
 & && 2x_5x_6 \geq x_3^2
 \end{aligned} \tag{3.2}$$

is an example of a conic quadratic optimization problem. The problem involves some linear constraints, a quadratic cone and a rotated quadratic cone.

Implementation

Problem (3.2) can be implemented using the **MOSEK** C API as follows:

Listing 3.4: Source code solving problem (3.2).

```

#include <stdio.h>

#include "mosek.h" /* Include the MOSEK definition file. */

static void MSKAPI printstr(void *handle,
                             const char str[])
{
    printf("%s", str);
} /* printstr */

int main(int argc, const char *argv[])
{
    MSKrescodee r;

    const MSKint32t numvar = 6,
                    numcon = 1;

    MSKboundkeye bkc[] = { MSK_BK_FX };
    double blc[] = { 1.0 };
    double buc[] = { 1.0 };

    MSKboundkeye bkc[] = {MSK_BK_LO,
                          MSK_BK_LO,
                          MSK_BK_LO,
                          MSK_BK_FR,
                          MSK_BK_FR,
                          MSK_BK_FR};
    double blx[] = {0.0,
                    0.0,
                    0.0,
                    -MSK_INFINITY,
                    -MSK_INFINITY,
                    -MSK_INFINITY};
    double bux[] = {+MSK_INFINITY,
                    +MSK_INFINITY,
                    +MSK_INFINITY,
                    +MSK_INFINITY,
                    +MSK_INFINITY,
                    +MSK_INFINITY};

    double c[] = {0.0,
                  0.0,

```

```

        0.0,
        1.0,
        1.0,
        1.0});

MSKint32t  aptrb[] = {0, 1, 2, 3, 3, 3},
           aptre[] = {1, 2, 3, 3, 3, 3},
           asub[]  = {0, 0, 0, 0};
double     aval[]  = {1.0, 1.0, 2.0};

MSKint32t  i,j, csub[3];

MSKenv_t    env  = NULL;
MSKtask_t   task = NULL;

/* Create the mosek environment. */
r = MSK_makeenv(&env, NULL);

if ( r==MSK_RES_OK )

    /* Run optimizer */
    r = MSK_optimizetrm(task,&trmcode);

    /* Print a summary containing information
       about the solution for debugging purposes*/
    MSK_solutionsummary (task,MSK_STREAM_MSG);

    if ( r==MSK_RES_OK )
    {
        MSKsolstae solsta;

        MSK_getsolsta (task,MSK_SOL_ITR,&solsta);

        switch(solsta)
        {
            case MSK_SOL_STA_OPTIMAL:
            case MSK_SOL_STA_NEAR_OPTIMAL:
            {
                double *xx = NULL;

                xx = calloc(numvar,sizeof(double));
                if ( xx )

```

```

        {
            MSK_getxx (task,
                      MSK_SOL_ITR,    /* Request the interior solution. */
                      xx);

            printf("Optimal primal solution\n");
            for(j=0; j<numvar; ++j)
                printf("x[%d]: %e\n",j,xx[j]);
        }
        else
        {
            r = MSK_RES_ERR_SPACE;
        }
        free(xx);
    }
    break;
case MSK_SOL_STA_DUAL_INFEAS_CER:
case MSK_SOL_STA_PRIM_INFEAS_CER:
case MSK_SOL_STA_NEAR_DUAL_INFEAS_CER:
case MSK_SOL_STA_NEAR_PRIM_INFEAS_CER:
    printf("Primal or dual infeasibility certificate found.\n");
    break;
case MSK_SOL_STA_UNKNOWN:
    printf("The status of the solution could not be determined.\n");
    break;
default:
    printf("Other solution status.");
    break;
}
}
else
{
    printf("Error while optimizing.\n");
}
}

if (r != MSK_RES_OK)
{
    /* In case of an error print error code and description. */
    char symname[MSK_MAX_STR_LEN];
    char desc[MSK_MAX_STR_LEN];

    printf("An error occurred while optimizing.\n");
    MSK_getcodedesc (r,
                    symname,
                    desc);
    printf("Error %s - '%s'\n",symname,desc);
}
}

/* Delete the task and the associated data. */
MSK_deletetask(&task);
}

/* Delete the environment and the associated data. */
MSK_deleteenv(&env);

return ( r );
} /* main */

```

The only new function introduced in the example is `task.appendcone`, which is called here:

```

r = MSK_appendcone(task,
    MSK_CT_QUAD,
    0.0, /* For future use only, can be set to 0.0 */
    3,
    csub);

```

The first argument selects the type of quadratic cone. Either `MSK_CT_QUAD` for a *quadratic cone* or `MSK_CT_RQUAD` for a *rotated quadratic cone*. The cone parameter `0.0` is currently not used by **MOSEK** — simply passing `0.0` will work.

The next argument denotes the number of variables in the cone, in this case `3`, and the last argument is a list of indexes of the variables in the cone.

3.4 Semidefinite Optimization

Semidefinite optimization is a generalization of conic quadratic optimization, allowing the use of matrix variables belonging to the convex cone of positive semidefinite matrices

$$\mathcal{S}_+^r = \{X \in \mathcal{S}^r : z^T X z \geq 0, \quad \forall z \in \mathbb{R}^r\},$$

where \mathcal{S}^r is the set of $r \times r$ real-valued symmetric matrices.

MOSEK can solve semidefinite optimization problems of the form

$$\begin{aligned}
 & \text{minimize} && \sum_{j=0}^{n-1} c_j x_j + \sum_{j=0}^{p-1} \langle \bar{C}_j, \bar{X}_j \rangle + c^f \\
 & \text{subject to} && l_i^c \leq \sum_{j=0}^{n-1} a_{ij} x_j + \sum_{j=0}^{p-1} \langle \bar{A}_{ij}, \bar{X}_j \rangle \leq u_i^c, \quad i = 0, \dots, m-1, \\
 & && l_j^x \leq x_j \leq u_j^x, \quad j = 0, \dots, n-1, \\
 & && x \in \mathcal{K}, \bar{X}_j \in \mathcal{S}_+^{r_j}, \quad j = 0, \dots, p-1
 \end{aligned}$$

where the problem has p symmetric positive semidefinite variables $\bar{X}_j \in \mathcal{S}_+^{r_j}$ of dimension r_j with symmetric coefficient matrices $\bar{C}_j \in \mathcal{S}^{r_j}$ and $\bar{A}_{ij} \in \mathcal{S}^{r_j}$. We use standard notation for the matrix inner product, i.e., for $A, B \in \mathbb{R}^{m \times n}$ we have

$$\langle A, B \rangle := \sum_{i=0}^{m-1} \sum_{j=0}^{n-1} A_{ij} B_{ij}.$$

3.4.1 Example SDO1

The problem

$$\begin{aligned}
 & \text{minimize} && \left\langle \begin{bmatrix} 2 & 1 & 0 \\ 1 & 2 & 1 \\ 0 & 1 & 2 \end{bmatrix}, \bar{X} \right\rangle + x_0 \\
 & \text{subject to} && \left\langle \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \bar{X} \right\rangle + x_0 = 1, \\
 & && \left\langle \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}, \bar{X} \right\rangle + x_1 + x_2 = 1/2, \\
 & && x_0 \geq \sqrt{x_1^2 + x_2^2}, \quad \bar{X} \succeq 0,
 \end{aligned} \tag{3.3}$$

is a mixed semidefinite and conic quadratic programming problem with a 3-dimensional semidefinite variable

$$\bar{X} = \begin{bmatrix} \bar{X}_{00} & \bar{X}_{10} & \bar{X}_{20} \\ \bar{X}_{10} & \bar{X}_{11} & \bar{X}_{21} \\ \bar{X}_{20} & \bar{X}_{21} & \bar{X}_{22} \end{bmatrix} \in \mathcal{S}_+^3,$$

and a conic quadratic variable $(x_0, x_1, x_2) \in \mathcal{Q}^3$. The objective is to minimize

$$2(\bar{X}_{00} + \bar{X}_{10} + \bar{X}_{11} + \bar{X}_{21} + \bar{X}_{22}) + x_0,$$

subject to the two linear constraints

$$\bar{X}_{00} + \bar{X}_{11} + \bar{X}_{22} + x_0 = 1,$$

and

$$\bar{X}_{00} + \bar{X}_{11} + \bar{X}_{22} + 2(\bar{X}_{10} + \bar{X}_{20} + \bar{X}_{21}) + x_1 + x_2 = 1/2.$$

Problem (3.3) is implemented in Listing 3.5.

Listing 3.5: Source code solving problem (3.3).

```

Source code comments

This example introduces several new functions. The first new function `task.appendbarvars` is used to append the semidefinite variable:

```
r = MSK_appendbarvars(task, NUMBARVAR, DIMBARVAR);
```

Symmetric matrices are created using the function `task.appendsparsesymmat`:

```

r = MSK_appendsparsesymmat(task,
                           DIMBARVAR[0],
                           5,
                           barc_i,
                           barc_j,
                           barc_v,
                           &idx);

```

The second argument specifies the dimension of the symmetric variable and the third argument gives the number of non-zeros in the lower triangular part of the matrix. The next three arguments specify the non-zeros in the lower-triangle in triplet format, and the last argument will be updated with a unique index of the created symmetric matrix.

After one or more symmetric matrices have been created using `task.appendsparsesymmat`, we can combine them to setup a objective matrix coefficient \bar{C}_j using `task.putbarcj`, which forms a linear combination of one more symmetric matrices:

```
r = MSK_putbarcj(task, 0, 1, &idx, &falpha);
```

The second argument specifies the semidefinite variable index j ; in this example there is only a single variable, so the index is 0. The next three arguments give the number of matrices used in the linear combination, their indices (as returned by `task.appendsparsesymmat`), and the weights for the individual matrices, respectively. In this example, we form the objective matrix coefficient directly from a single symmetric matrix.

Similarly, a constraint matrix coefficient \bar{A}_{ij} is setup by the function `task.putbaraij`:

```
r = MSK_putbaraij(task, 0, 0, 1, &idx, &falpha);
```

where the second argument specifies the constraint number (the corresponding row of \bar{A}), and the third argument specifies the semidefinite variable index (the corresponding column of \bar{A}). The next three arguments specify a weighted combination of symmetric matrices used to form the constraint matrix coefficient. After the problem is solved, we read the solution using `task.getbarxj`:

```

MSK_getbarxj(task,
             MSK_SOL_ITR, /* Request the interior solution. */
             0,
             barx);

```

The function returns the half-vectorization of \bar{X}_j (the lower triangular part stacked as a column vector), where the semidefinite variable index j is given in the second argument, and the third argument is a pointer to an array for storing the numerical values.

3.5 Quadratic Optimization

MOSEK can solve quadratic and quadratically constrained convex problems. This class of problems can be formulated as follows:

$$\begin{aligned} & \text{minimize} && \frac{1}{2}x^T Q^o x + c^T x + c^f \\ & \text{subject to} && l_k^c \leq \frac{1}{2}x^T Q^k x + \sum_{j=0}^{n-1} a_{k,j} x_j \leq u_k^c, \quad k = 0, \dots, m-1, \\ & && l_j^x \leq x_j \leq u_j^x, \quad j = 0, \dots, n-1. \end{aligned} \quad (3.4)$$

Without loss of generality it is assumed that Q^o and Q^k are all symmetric because

$$x^T Q x = \frac{1}{2}x^T (Q + Q^T) x.$$

This implies that a non-symmetric Q can be replaced by the symmetric matrix $\frac{1}{2}(Q + Q^T)$.

The problem is required to be convex. More precisely, the matrix Q^o must be positive semi-definite and the k th constraint must be of the form

$$l_k^c \leq \frac{1}{2}x^T Q^k x + \sum_{j=0}^{n-1} a_{k,j} x_j \leq u_k^c \quad (3.5)$$

with a negative semi-definite Q^k or of the form

$$\frac{1}{2}x^T Q^k x + \sum_{j=0}^{n-1} a_{k,j} x_j \leq u_k^c.$$

with a positive semi-definite Q^k . This implies that quadratic equalities are *not* allowed. Specifying a non-convex problem will result in an error when the optimizer is called.

A matrix is positive semidefinite if the smallest eigenvalue of the matrix is nonnegative. An alternative statement of the positive semidefinite requirement is

$$x^T Q x \geq 0, \quad \forall x.$$

If Q is not positive semidefinite, then **MOSEK** will not produce reliable results or work at all.

One way of checking whether Q is positive semidefinite is to check whether all the eigenvalues of Q are nonnegative.

3.5.1 Example: Quadratic Objective

$$\begin{aligned} & \text{minimize} && x_1^2 + 0.1x_2^2 + x_3^2 - x_1x_3 - x_2 \\ & \text{subject to} && 1 \leq x_1 + x_2 + x_3 \\ & && x \geq 0. \end{aligned} \quad (3.6)$$

For the example (3.6) implies that

$$Q = \begin{bmatrix} 2 & 0 & -1 \\ 0 & 0.2 & 0 \\ -1 & 0 & 2 \end{bmatrix}, c = \begin{bmatrix} 0 \\ -1 \\ 0 \end{bmatrix}, A = \begin{bmatrix} 1 & 1 & 1 \end{bmatrix},$$

and that

$$l^c = 1, u^c = \infty, l^x = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \text{ and } u^x = \begin{bmatrix} \infty \\ \infty \\ \infty \end{bmatrix}$$

Please note the explicit $\frac{1}{2}$ in the objective function of (3.4) which implies that diagonal elements must be doubled in Q , i.e. $Q_{11} = 2$, whereas the coefficient in (3.6) is 1 in front of x_1^2 .

Important: **MOSEK** assumes that the Q matrix is symmetric, i.e. $Q = Q^T$, and that Q is *positive semidefinite*.

The source code follows in [Listing 3.6](#).

Listing 3.6: Source code implementing problem (3.6).

} /* main */

```

Example code comments

Most of the functionality in this example has already been explained for the linear optimization example in Section 3.2 and it will not be repeated here.

This example introduces one new function, `task.putqobj`, which is used to input the quadratic terms of the objective function.

Since Q^o is symmetric only the lower triangular part of Q^o is inputted. The upper part of Q^o is computed by **MOSEK** using the relation

$$Q_{ij}^o = Q_{ji}^o.$$

Entries from the upper part may *not* appear in the input.

The lower triangular part of the matrix Q^o is specified using an unordered sparse triplet format (for details, see Section 16.1.3):

```

qsubi[0] = 0;  qsubj[0] = 0;  qval[0] = 2.0;
qsubi[1] = 1;  qsubj[1] = 1;  qval[1] = 0.2;
qsubi[2] = 2;  qsubj[2] = 0;  qval[2] = -1.0;
qsubi[3] = 2;  qsubj[3] = 2;  qval[3] = 2.0;

```

Please note that

- only non-zero elements are specified (any element not specified is 0 by definition),
- the order of the non-zero elements is insignificant, and
- *only* the lower triangular part should be specified.

Finally, the matrix Q^o is loaded into the task:

```

r = MSK_putqobj(task, NUMQNZ, qsubi, qsubj, qval);

```

3.5.2 Example: Quadratic constraints

In this section describes how to solve a problem with quadratic constraints. Please note that quadratic constraints are subject to the convexity requirement (3.5).

Consider the problem:

$$\begin{aligned}
 & \text{minimize} && x_1^2 + 0.1x_2^2 + x_3^2 - x_1x_3 - x_2 \\
 & \text{subject to} && 1 \leq x_1 + x_2 + x_3 - x_1^2 - x_2^2 - 0.1x_3^2 + 0.2x_1x_3, \\
 & && x \geq 0.
 \end{aligned}$$

This is equivalent to

$$\begin{aligned}
 & \text{minimize} && \frac{1}{2}x^T Q^o x + c^T x \\
 & \text{subject to} && \frac{1}{2}x^T Q^0 x + Ax \geq b,
 \end{aligned} \tag{3.7}$$

where

$$Q^o = \begin{bmatrix} 2 & 0 & -1 \\ 0 & 0.2 & 0 \\ -1 & 0 & 2 \end{bmatrix}, c = [0 \ -10], A = \begin{bmatrix} 1 & 1 & 1 \end{bmatrix}, b = 1.$$

$$Q^0 = \begin{bmatrix} -2 & 0 & 0.2 \\ 0 & -2 & 0 \\ 0.2 & 0 & -0.2 \end{bmatrix}.$$

}
}

MSK_deletetask(&task);
}
MSK_deleteenv(&env);

return ( r );
} /* main */
```

The only new function introduced in this example is `task.putqconk`, which is used to add quadratic terms to the constraints. While `task.putqconk` add quadratic terms to a specific constraint, it is also possible to input all quadratic terms in all constraints in one chunk using the `task.putqcon` function.

3.6 Integer Optimization

An optimization problem where one or more of the variables are constrained to integer values is denoted an integer optimization problem.

Section 3.6.2 shows how to input an initial feasible solution to help the solver.

3.6.1 Example MILO1

In this section the example

$$\begin{aligned}
 &\text{maximize} && x_0 + 0.64x_1 \\
 &\text{subject to} && 50x_0 + 31x_1 \leq 250, \\
 & && 3x_0 - 2x_1 \geq -4, \\
 & && x_0, x_1 \geq 0 \quad \text{and integer}
 \end{aligned} \tag{3.8}$$

is used to demonstrate how to solve a problem with integer variables.

The example (3.8) is almost identical to a linear optimization problem (see 3.2) except for some variables being integer constrained. Therefore, only the specification of the integer constraints requires something new compared to the linear optimization problem discussed previously.

In **MOSEK** these constraints are specified using the function `task.putvartype` as shown in the code:

```
for(j=0; j<numvar && r == MSK_RES_OK; ++j)
    r = MSK_putvartype(task,j,MSK_VAR_TYPE_INT);
```

The complete source for the example is listed Listing 3.8. Please note that when `task.getsolutionslice` is called, the integer solution is requested by using `MSK_SOL_ITG`. No dual solution is defined for integer optimization problems.

Listing 3.8: Source code implementing problem (3.8).

```
#include <stdio.h>

#include "mosek.h" /* Include the MOSEK definition file. */

```

Solving a mixed-integer optimization program could easily result in long running time. It is therefore of interest to consider a termination criterion based on the maximum running time. This is possible setting the `MSK_DPAR_MIO_MAX_TIME`. See Section 3.10 for more details on how to set solver parameters.

3.6.2 Specifying an initial solution

Integer optimization problems are generally hard to solve, but the solution time can often be reduced by providing an initial solution for the solver. It is not necessary to specify the whole solution. By setting the `MSK_IPAR_MIO_CONSTRUCT_SOL` parameter to `MSK_ON` and inputting values for the integer variables only, will force **MOSEK** to compute the remaining continuous variable values.

If the specified integer solution is infeasible or incomplete, **MOSEK** will simply ignore it.

Consider the problem

$$\begin{aligned}
 &\text{maximize} && 7x_0 + 10x_1 + x_2 + 5x_3 \\
 &\text{subject to} && x_0 + x_1 + x_2 + x_3 \leq 2.5 \\
 &&& x_0, x_1, x_2 \in \mathbb{Z} \\
 &&& x_0, x_1, x_2, x_3 \geq 0
 \end{aligned} \tag{3.9}$$

The following example demonstrates how to optimize the problem using a feasible starting solution generated by selecting the integer values as $x_0 = 0, x_1 = 2, x_2 = 0$.

Solution values can be set using `task.putsolution` (for inputting a whole solution) or `task.putsolutioni` (for inputting solution values related to a single variable or constraint).

Listing 3.9: Implementation of problem (3.9) specifying an initial solution.

```

#include "mosek.h"
#include <stdio.h>

static void MSKAPI printstr(void *handle,
                             const char str[])
{
    printf("%s",str);
} /* printstr */

int main(int argc,char *argv[])
{
    char          buffer[512];

```

3.7 Optimizer Termination Handling

After solving an optimization problem with **MOSEK** an appropriate action must be taken depending on the outcome. Usually the expected outcome is an optimal solution, but there may be several situations where this is not the result. E.g., if the problem is infeasible or nearly so or if the solver ran out of memory or stalled while optimizing, the result may not be as expected.

This section discusses what should be considered when an optimization has ended unsuccessfully.

Before continuing, let us consider the four status codes available in **MOSEK** that is relevant for the error handling:

- **Termination code:** It provides information about why the optimizer terminated. For instance if a time limit has been specified (this is common for mixed integer problems), the termination code will tell if this termination limit was the cause of the termination. Note that reaching a prespecified time limit is not considered an exceptional case. It must be expected that this occurs occasionally.
- **Response code:** It is an information about the system status and the outcome of the call to a **MOSEK** functionalities. This code is used to report the unexpected failures such as out of space.

The response code is the returned value of most functions of the API, and its type is *MSKrescodetype*. See 16.5 for a list of possible return codes.

- **Solution status:** It contains information about the status of the solution, e.g., whether the solution is optimal or a certificate of infeasibility.
- **Problem status:** It describes what **MOSEK** knows about the feasibility of the problem, i.e., if the problem is feasible or infeasible.

The problem status is mostly used for integer problems. For continuous problems a problem status of, say, *infeasible* will always mean that the solution is a certificate of infeasibility. For integer problems it is not possible to provide a certificate, and thus a separate problem status is useful.

Note that if we want to report, e.g., that the optimizer terminated due to a time limit or because it stalled but with a feasible solution, we have to consider *both* the termination code, *and* the solution status.

The following pseudo code demonstrates a best practice way of dealing with the status codes.

- if (the solution status is as expected)
 - **The normal case:**

Do whatever that was planned. Note the response code is ignored because the solution has the expected status. Of course we may check the response anyway if we like.
- else
 - **Exceptional case:**

Based on solution status, response and termination codes take appropriate action.

In Listing 3.10 the pseudo code is implemented. The idea of the example is to read an optimization problem from a file, e.g., an MPS file and optimize it. Based on status codes an appropriate action is taken, which in this case is to print a suitable message.

Listing 3.10: A typical code that handle **MOSEK** response code.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

#include "mosek.h"

void MSKAPI printlog(void *ptr,
                    const char s[])
{
    printf("%s",s);
} /* printlog */

int main(int argc, char const *argv[])
{
    MSKenv_t    env;
    MSKrescodee r;
    MSKtask_t   task;

    if ( argc<2 )
    {
        printf("No input file specified\n");
        exit(0);
    }
    else
        printf("Inputfile:  %s\n",argv[1]);

    r = MSK_makeenv(&env,NULL);

    if ( r==MSK_RES_OK )
    {
        r = MSK_makeemptytask(env,&task);
        if ( r==MSK_RES_OK )
            MSK_linkfunctotaskstream(task, MSK_STREAM_LOG, NULL,    printlog);

        r = MSK_readdata(task,argv[1]);
        if ( r==MSK_RES_OK )
        {
            MSKrescodee trmcode;
            MSKsolstae  solsta;

            r = MSK_optimizetrm(task,&trmcode); /* Do the optimization. */

            /* Expected result: The solution status of the basic solution is optimal. */

            if ( MSK_RES_OK==MSK_getsolsta(task,MSK_SOL_ITR,&solsta) )
            {
                switch( solsta )
                {
                    case MSK_SOL_STA_OPTIMAL:
                    case MSK_SOL_STA_NEAR_OPTIMAL:
                        printf("An optimal basic solution is located.\n");

                        MSK_solutionsummary(task,MSK_STREAM_MSG);
                        break;
                    case MSK_SOL_STA_DUAL_INFEAS_CER:
                    case MSK_SOL_STA_NEAR_DUAL_INFEAS_CER:
                        printf("Dual infeasibility certificate found.\n");
                }
            }
        }
    }
}
```

```

        break;
    case MSK_SOL_STA_PRIM_INFEAS_CER:
    case MSK_SOL_STA_NEAR_PRIM_INFEAS_CER:
        printf("Primal infeasibility certificate found.\n");
        break;
    case MSK_SOL_STA_UNKNOWN:
    {
        char symname[MSK_MAX_STR_LEN];
        char desc[MSK_MAX_STR_LEN];

        /* The solutions status is unknown. The termination code
           indicating why the optimizer terminated prematurely. */

        printf("The solution status is unknown.\n");
        if ( r!=MSK_RES_OK )
        {
            /* A system failure e.g. out of space. */

            MSK_getcodedesc(r,symname,desc);

            printf("  Response code: %s\n",symname);
        }
        else
        {
            /* No system failure e.g. an iteration limit is reached. */

            MSK_getcodedesc(trmcode,symname,desc);

            printf("  Termination code: %s\n",symname);
        }
        break;
    }
    default:
        printf("An unexpected solution status is obtained.\n");
        break;
    }
}
else
    printf("Could not obtain the solution status for the requested solution.\n");
}
MSK_deletetask(&task);

MSK_deleteenv(&env);
printf("Return code: %d (0 means no error occurred.)\n",r);

return ( r );
} /* main */

```

3.8 Problem Modification and Reoptimization

Often one might want to solve not just a single optimization problem, but a sequence of problem, each differing only slightly from the previous one. This section demonstrates how to modify and re-optimize an existing problem. The example we study is a simple production planning model.

Problem modifications regarding variables, cones, objective function and constraints can be grouped in three categories:

- add/remove,
- coefficient modifications,

- bounds modifications.

These operations may be costly and, especially removing variables and constraints. Special care must be taken with respect to constraints and variable indexes that may be invalidated.

Depending on the type of modification, **MOSEK** may be able to optimize the modified problem more efficiently exploiting the information and internal state from the previous execution.

For instance the former optimal solution may be still feasible, but no more optimal; or for tiny modifications of the objective function it may be still optimal. This is a special case that we discuss in Section 15.

In general, **MOSEK** exploits dual information and the availability of an optimal basis from the previous execution. The simplex optimizer is well suited for exploiting an existing primal or dual feasible solution. Restarting capabilities for interior-point methods are still not reliable and effective as those for the simplex algorithm. More information can be found in Chapter 10 of the book [Chv83].

3.8.1 Example: Production Planning

A company manufactures three types of products. Suppose the stages of manufacturing can be split into three parts, namely Assembly, Polishing and Packing. In the table below we show the time required for each stage as well as the profit associated with each product.

Product no.	Assembly (minutes)	Polishing (minutes)	Packing (minutes)	Profit (\$)
0	2	3	2	1.50
1	4	2	3	2.50
2	3	3	2	3.00

With the current resources available, the company has 100,000 minutes of assembly time, 50,000 minutes of polishing time and 60,000 minutes of packing time available per year.

Now the question is how many items of each product the company should produce each year in order to maximize profit?

Denoting the number of items of each type by x_0, x_1 and x_2 , this problem can be formulated as the linear optimization problem:

$$\begin{aligned}
 &\text{maximize} && 1.5x_0 + 2.5x_1 + 3.0x_2 \\
 &\text{subject to} && 2x_0 + 4x_1 + 3x_2 \leq 100000, \\
 &&& 3x_0 + 2x_1 + 3x_2 \leq 50000, \\
 &&& 2x_0 + 3x_1 + 2x_2 \leq 60000,
 \end{aligned} \tag{3.10}$$

and

$$x_0, x_1, x_2 \geq 0.$$

Code in Listing 3.11 loads and solves this problem:

Listing 3.11: How to load problem (3.10)

```

const MSKint32t numvar = 3,
               numcon = 3;
MSKint32t      i,j;
double         c[]   = {1.5, 2.5, 3.0};
MSKint32t      ptrb[] = {0, 3, 6},
               ptre[] = {3, 6, 9},
               asub[] = { 0, 1, 2,
                        0, 1, 2,
                        0, 1, 2};

double         aval[] = { 2.0, 3.0, 2.0,
                        4.0, 2.0, 3.0,
                        3.0, 3.0, 2.0};

```

```

MSKboundkeye    bkc[] = {MSK_BK_UP, MSK_BK_UP, MSK_BK_UP    };
double          blc[] = {-MSK_INFINITY, -MSK_INFINITY, -MSK_INFINITY};
double          buc[] = {100000, 50000, 60000};

MSKboundkeye    bkc[] = {MSK_BK_LO,      MSK_BK_LO,      MSK_BK_LO};
double          blx[] = {0.0,           0.0,           0.0,};
double          bux[] = {+MSK_INFINITY, +MSK_INFINITY, +MSK_INFINITY};

double          *xx=NULL;
MSKenv_t        env;
MSKtask_t       task;
MSKint32t       varidx, conidx;
MSKrescodee     r;

/* Create the mosek environment. */
r = MSK_makeenv(&env, NULL);

if ( r==MSK_RES_OK )
{
    /* Create the optimization task. */
    r = MSK_maketask(env, numcon, numvar, &task);

    /* Directs the log task stream to the
       'printstr' function. */

    MSK_linkfunctotaskstream(task, MSK_STREAM_LOG, NULL, printstr);

    /* Append the constraints. */
    if (r == MSK_RES_OK)
        r = MSK_appendcons(task, numcon);

    /* Append the variables. */
    if (r == MSK_RES_OK)
        r = MSK_appendvars(task, numvar);

    /* Put C. */
    if (r == MSK_RES_OK)
        r = MSK_putcfix(task, 0.0);

    if (r == MSK_RES_OK)
        for(j=0; j<numvar; ++j)
            r = MSK_putcj(task, j, c[j]);

    /* Put constraint bounds. */
    if (r == MSK_RES_OK)
        for(i=0; i<numcon; ++i)
            r = MSK_putconbound(task, i, bkc[i], blc[i], buc[i]);

    /* Put variable bounds. */
    if (r == MSK_RES_OK)
        for(j=0; j<numvar; ++j)
            r = MSK_putvarbound(task, j, bkc[j], blx[j], bux[j]);

    /* Put A. */
    if (r == MSK_RES_OK)
        if ( numcon>0 )
            for(j=0; j<numvar; ++j)
                r = MSK_putacol(task,
                                j,
                                ptre[j]-ptrb[j],
                                asub+ptrb[j],
                                aval+ptrb[j]);
}

```

```

if (r == MSK_RES_OK)
    r = MSK_putobjsense(task,
                        MSK_OBJECTIVE_SENSE_MAXIMIZE);

if (r == MSK_RES_OK)
    r = MSK_optimizetrm(task, NULL);

if (r == MSK_RES_OK)
{
    xx = calloc(numvar, sizeof(double));
    if ( !xx )
        r = MSK_RES_ERR_SPACE;
}

if (r == MSK_RES_OK)
    r = MSK_getxx(task,
                  MSK_SOL_BAS,      /* Basic solution.      */
                  xx);

```

3.8.2 Changing the A Matrix

Suppose we want to change the time required for assembly of product 0 to 3 minutes. This corresponds to setting $a_{0,0} = 3$, which is done by calling the function `task.putaij` as shown below.

```

if (r == MSK_RES_OK)
    r = MSK_putaij(task, 0, 0, 3.0);

```

The problem now has the form:

$$\begin{array}{llllll}
 \text{maximize} & 1.5x_0 & + & 2.5x_1 & + & 3.0x_2 \\
 \text{subject to} & 3x_0 & + & 4x_1 & + & 3x_2 & \leq & 100000, \\
 & 3x_0 & + & 2x_1 & + & 3x_2 & \leq & 50000, \\
 & 2x_0 & + & 3x_1 & + & 2x_2 & \leq & 60000,
 \end{array} \tag{3.11}$$

and

$$x_0, x_1, x_2 \geq 0.$$

After changing the A matrix we can find the new optimal solution by calling `task.optimize` again

3.8.3 Appending Variables

We now want to add a new product with the following data:

Product no.	Assembly (minutes)	Polishing (minutes)	Packing (minutes)	Profit (\$)
3	4	0	1	1.00

This corresponds to creating a new variable x_3 , appending a new column to the A matrix and setting a new value in the objective. We do this in [Listing 3.12](#)

Listing 3.12: How to add a column.

```

/* Get index of new variable, this should be 3 */
if (r == MSK_RES_OK)
    r = MSK_getnumvar(task, &varidx);

/* Append a new variable x_3 to the problem */

```

```

if (r == MSK_RES_OK)
    r = MSK_appendvars(task,1);

/* Set bounds on new variable */
if (r == MSK_RES_OK)
    r = MSK_putvarbound(task,
                        varidx,
                        MSK_BK_LO,
                        0,
                        +MSK_INFINITY);

/* Change objective */
if (r == MSK_RES_OK)
    r = MSK_putcj(task,varidx,1.0);

/* Put new values in the A matrix */
if (r == MSK_RES_OK)
{
    MSKint32t acolsub[] = {0, 2};
    double    acolval[] = {4.0, 1.0};

    r = MSK_putacol(task,
                    varidx, /* column index */
                    2, /* num nz in column */
                    acolsub,
                    acolval);
}

```

After this operation the problem looks this way:

$$\begin{array}{llllll}
 \text{maximize} & 1.5x_0 & + & 2.5x_1 & + & 3.0x_2 & + & 1.0x_3 \\
 \text{subject to} & 3x_0 & + & 4x_1 & + & 3x_2 & + & 4x_3 & \leq & 100000, \\
 & 3x_0 & + & 2x_1 & + & 3x_2 & & & \leq & 50000, \\
 & 2x_0 & + & 3x_1 & + & 2x_2 & + & 1x_3 & \leq & 60000,
 \end{array} \tag{3.12}$$

and

$$x_0, x_1, x_2, x_3 \geq 0.$$

3.8.4 Reoptimization

When *task.optimize* is called **MOSEK** will store the optimal solution internally. After a task has been modified and *task.optimize* is called again the solution will automatically be used to reduce solution time of the new problem, if possible.

In this case an optimal solution to problem (3.11) was found and then added a column was added to get (3.12). We let **MOSEK** select the suitable simplex algorithm to perform reoptimization.

```

/* Change optimizer to free simplex and reoptimize */
if (r == MSK_RES_OK)
    r = MSK_putintparam(task,MSK_IPAR_OPTIMIZER,MSK_OPTIMIZER_FREE_SIMPLEX);

if (r == MSK_RES_OK)
    r = MSK_optimizetrm(task,NULL);

```

3.8.5 Appending Constraints

Now suppose we want to add a new stage to the production called *Quality control* for which 30000 minutes are available. The time requirement for this stage is shown below:

Product no.	Quality control (minutes)
0	1
1	2
2	1
3	1

This corresponds to adding the constraint

$$x_0 + 2x_1 + x_2 + x_3 \leq 30000$$

to the problem which is done in the following code:

```

/* Get index of new constraint */
if (r == MSK_RES_OK)
    r = MSK_getnumcon(task,&conidx);

/* Append a new constraint */
if (r == MSK_RES_OK)
    r = MSK_appendcons(task,1);

/* Set bounds on new constraint */
if (r == MSK_RES_OK)
    r = MSK_putconbound(task,
                        conidx,
                        MSK_BK_UP,
                        -MSK_INFINITY,
                        30000);

/* Put new values in the A matrix */
if (r == MSK_RES_OK)

    MSKidx_t arowsub[] = {0, 1, 2, 3 };
    double arowval[] = {1.0, 2.0, 1.0, 1.0};

    r = MSK_putarow(task,
                    conidx, /* row index */
                    4,      /* num nz in row */
                    arowsub,
                    arowval);
}

```

3.9 Solution Analysis

The main purpose of **MOSEK** is to solve optimization problems and therefore the most fundamental question to be asked is whether the solution reported by **MOSEK** is a solution to the desired optimization problem.

There can be several reasons why it might be not case. The most prominent reasons are:

- A wrong problem. The problem inputted to **MOSEK** is simply not the right problem, i.e. some of the data may have been corrupted or the model has been incorrectly built.
- Numerical issues. The problem is badly scaled or otherwise badly posed.
- Other reasons. E.g. not enough memory or an explicit user request to stop.

The first step in verifying that **MOSEK** reports the expected solution is to inspect the solution summary generated by **MOSEK** (see Section 3.9.1). The solution summary provides information about

- the problem and solution statuses,
- objective value and infeasibility measures for the primal solution, and

- objective value and infeasibility measures for the dual solution, where applicable.

By inspecting the solution summary it can be verified that **MOSEK** produces a feasible solution, and, in the continuous case, the optimality can be checked using the dual solution. Furthermore, the problem itself can be inspected using the problem analyzer discussed in Section 13.

If the summary reports conflicting information (e.g. a solution status that does not match the actual solution), or the cause for terminating the solver before a solution was found cannot be traced back to the reasons stated above, it may be caused by a bug in the solver; in this case, please contact **MOSEK** support (see Section 1.2).

If it has been verified that **MOSEK** solves the problem correctly but the solution is still not as expected, next step is to verify that the primal solution satisfies all the constraints. Hence, using the original problem it must be determined whether the solution satisfies all the required constraints in the model. For instance assume that the problem has the constraints

$$\begin{aligned} x_1 + 2x_2 + x_3 &\leq 1, \\ x_1, x_2, x_3 &\geq 0 \end{aligned}$$

and **MOSEK** reports the optimal solution

$$x_1 = x_2 = x_3 = 1.$$

Then clearly the solution violates the constraints. The most likely explanation is that the model does not match the problem entered into **MOSEK**, for instance

$$x_1 - 2x_2 + x_3 \leq 1$$

may have been inputted instead of

$$x_1 + 2x_2 + x_3 \leq 1.$$

A good way to debug such an issue is to dump the problem to *OPF file* and check whether the violated constraint has been specified correctly.

Verifying that a feasible solution is optimal can be harder. However, for continuous problems, i.e. problems without any integer constraints, optimality can be verified using a dual solution. Normally, **MOSEK** will report a dual solution; if that is feasible and has the same objective value as the primal solution, then the primal solution must be optimal.

An alternative method is to find another primal solution that has better objective value than the one reported to **MOSEK**. If that is possible then either the problem is badly posed or there is a bug in **MOSEK**.

3.9.1 The Solution Summary

Due to **MOSEK** employs finite precision floating point numbers then reported solution is an approximate optimal solution. Therefore after solving an optimization problem it is relevant to investigate how good an approximation the solution is. For a convex optimization problem that is an easy task because the optimality conditions are:

- The primal solution must satisfy all the primal constraints.
- The dual solution must satisfy all the dual constraints.
- The primal and dual objective values must be identical.

Therefore, the **MOSEK** solution summary displays that information that makes it possible to verify the optimality conditions. Indeed the solution summary reports how much primal and dual solutions violate the primal and constraints respectively. In addition the objective values associated with each solution are reported.

In case of a linear optimization problem the solution summary may look like

Basic solution summary

```

Problem status : PRIMAL_AND_DUAL_FEASIBLE
Solution status : OPTIMAL
Primal.  obj: -4.6475314286e+002  nrm: 5e+002  Viol.  con: 1e-014  var: 1e-014
Dual.    obj: -4.6475314543e+002  nrm: 1e+001  Viol.  con: 4e-009  var: 4e-016

```

The interpretation of the solution summary is as follows:

- Information for the basic solution is reported.
- The problem status is primal and dual feasible which means the problem has an optimal solution.
- The solution status is optimal.
- Next information about the primal solution is reported. The information consists of the objective value, the infinity norm of the primal solution and violation measures. The violation for the constraints (`con:`) is the maximal violation in any of the constraints. Whereas the violations for the variables (`var:`) is the maximal bound violation for any of the variables. In this case the primal violations for the constraints and variables are small meaning the solution is an almost feasible solution. Observe due to the rounding errors it can be expected that the violations are proportional to the size (`nrm:`) of the solution.
- Similarly for the dual solution the violations are small and hence the dual solution is almost feasible.
- Finally, it can be seen that the primal and dual objective values are almost identical.

To summarize in this case a primal and a dual solution only violate the primal and dual constraints slightly. Moreover, the primal and dual objective values are almost identical and hence it can be concluded that the reported solution is a good approximation to the optimal solution.

The reason the size (=norms) of the solution are shown is that it shows some about conditioning of the problem because if the primal and/or dual solution has very large norm then the violations and objective values are sensitive to small perturbations in the problem data. Therefore, the problem is unstable and care should be taken before using the solution.

Observe the function `task.solutionsummary` will print out the solution summary. In addition

- the problem status can be obtained using `task.getprosta`.
- the solution status can be obtained using `task.getsolsta`.
- the primal constraint and variable violations can be obtained with `task.getpviolcon` and `task.getpviolvar`.
- the dual constraint and variable violations can be obtained with `task.getdviolcon` and `task.getdviolvar` respectively.
- the primal and dual objective values can be obtained with `task.getprimalobj` and `task.getdualobj`.

Now what happens if the problem does not have an optimal solution e.g. is primal infeasible. In such a case the solution summary may look like

Interior-point solution summary

```

Problem status : PRIMAL_INFEASIBLE
Solution status : PRIMAL_INFEASIBLE_CER
Dual.    obj: 6.7319732555e+000  nrm: 8e+000  Viol.  con: 3e-010  var: 2e-009

```

i.e. **MOSEK** reports that the solution is a certificate of primal infeasibility but a certificate of primal infeasibility what does that mean? It means that the dual solution is a Farkas type certificate. Recall Farkas' Lemma says

$$\begin{aligned} Ax &= b, \\ x &\geq 0 \end{aligned}$$

if and only if a y exists such that

$$\begin{aligned} A^T y &\leq 0, \\ b^T y &> 0. \end{aligned} \tag{3.13}$$

Observe the infeasibility certificate has the same form as a regular dual solution and therefore the certificate is stored as a dual solution. In order to check quality of the primal infeasibility certificate it should be checked whether satisfies (3.13). Hence, the dual objective value is $b^T y$ should be strictly positive and the maximal violation in $A^T y \leq 0$ should be a small. In this case we conclude the certificate is of high quality because the dual objective is positive and large compared to the violations. Note the Farkas certificate is a ray so any positive multiple of that ray is also certificate. This implies the absolute of the value objective value and the violation is not relevant.

In the case a problem is dual infeasible then the solution summary may look like

```
Basic solution summary
Problem status : DUAL_INFEASIBLE
Solution status : DUAL_INFEASIBLE_CER
Primal.  obj: -2.0000000000e-002  nrm: 1e+000  Viol.  con: 0e+000  var: 0e+000
```

Observe when a solution is a certificate of dual infeasibility then the primal solution contains the certificate. Moreover, given the problem is a minimization problem the objective value should be negative and large compared to the worst violation if the certificate is strong.

Listing 3.13 shows how to use these function to determine the quality of the solution.

Listing 3.13: An example of solution quality analysis.

```
#include <math.h>
#include "mosek.h"

3.9.2 The Solution Summary for Mixed-Integer Problems

The solution summary for a mixed-integer problem may look like

Listing 3.14: Example of solution summary for a mixed-integer problem.

```
Integer solution solution summary
Problem status  : PRIMAL_FEASIBLE
Solution status : INTEGER_OPTIMAL
Primal.  obj: 3.4016000000e+005   nrm: 1e+000   Viol.  con: 0e+000   var: 0e+000   itg: 3e-014
```

The main difference compared to the continuous case covered previously is that no information about the dual solution is provided. Simply because there is no dual solution available for a mixed integer problem. In this case it can be seen that the solution is highly feasible because the violations are small. Moreover, the solution is denoted integer optimal. Observe *itg: 3e-014* implies that all the integer constrained variables are at most $3e - 014$ from being an exact integer.

3.10 Solver Parameters

The **MOSEK** API provides many parameters to tune and customize the solver behaviour. Parameters are grouped depending on their type: integer, double or string. In general, it should not be necessary to change any of the parameters but if required, it is easily done. A complete list of all parameters is found in Section 16.4.

We will show how to access and set the integer parameter that define the logging verbosity of the solver, i.e. *MSK_IPAR_LOG*, and the algorithm used by **MOSEK**, i.e. *MSK_IPAR_OPTIMIZER*.

Note: The very same concepts and procedures apply to string and double valued parameters.

To inspect the current value of a parameter, we can use the *task.getintparam*. In this example we say

```
res = MSK_getintparam(task, MSK_IPAR_LOG, &param);
```

To set a parameter the **MOSEK** API provides several functions that differ in the way the parameter name and value are specified.

A parameter can be accessed by an identifier using *task.putintparam*

```
res = MSK_putintparam(task, MSK_IPAR_LOG, 1);
```

If the specified value is not valid, the API will return an error code and the parameter left unchanged.

```
res = MSK_putintparam(task, MSK_IPAR_LOG, -1);
if( res != MSK_RES_OK) puts(" -1 rejected: not a valid value!");
```

The values for integer parameters are either simple integer values or enum values. Enumerations are provided mainly to improve readability and ensure compatibility.

In the next lines we show how to set the algorithm used by **MOSEK** to solve linear optimization problem. To that purpose we set the *MSK_IPAR_OPTIMIZER* parameter using a value from the *MSKoptimizertypee* enumeration: for instance we may decide to use the dual simplex algorithm, and thus

```
res = MSK_putintparam(task, MSK_IPAR_OPTIMIZER, MSK_OPTIMIZER_DUAL_SIMPLEX);
```

For more information about other parameter related functions, please browse the API reference in Section 16.

The complete code for this tutorial follows in Listing 3.15.

Listing 3.15: Parameter setting example.

```
#include "mosek.h"
#include "stdio.h"

int main()
{
    MSKenv_t env = NULL;
    MSKtask_t task = NULL;
    MSKrescodee res;

    int param=0;

    /* Create an environment */
    res = MSK_makeenv(&env, NULL);

    if (res == MSK_RES_OK)
    {
        /* Create a task */
        res = MSK_maketask(env, 0,0, &task);

        if( res == MSK_RES_OK)
        {
            puts("Test MOSEK parameter get/set functions");

            res = MSK_getintparam(task, MSK_IPAR_LOG, &param);
            printf("Default value for parameter MSK_IPAR_LOG= %d\n", param);

            puts(" setting to 1 using putintparam...");
            res = MSK_putintparam(task, MSK_IPAR_LOG, 1);

            puts(" setting to -1 using putintparam...");
            res = MSK_putintparam(task, MSK_IPAR_LOG, -1);
            if( res != MSK_RES_OK) puts(" -1 rejected: not a valid value!");
```

```
puts(" setting to 2 using putparam...");
res = MSK_putparam(task,"MSK_IPAR_LOG","2");

puts(" setting to 3 using putnaintparam...");
MSK_putnaintparam(task,"MSK_IPAR_LOG",3);

puts(" selecting the dual simplex algorithm...");
res = MSK_putintparam(task, MSK_IPAR_OPTIMIZER, MSK_OPTIMIZER_DUAL_SIMPLEX);

MSK_deletetask(&task);
}
MSK_deleteenv(&env);
}
return 0;
}
```

NONLINEAR TUTORIALS

This chapter provides information about how to solve general convex nonlinear optimization problems using **MOSEK**. By general nonlinear problems it is meant problems that cannot be formulated as a conic quadratic optimization or a convex quadratically constrained optimization problem.

In general it is recommended not to use nonlinear optimizer unless needed. The reasons are

- **MOSEK** has no way of checking whether the formulated problem is convex and if this assumption is not satisfied the optimizer will not work.
- The nonlinear optimizer requires 1st and 2nd order derivative information which is hard to provide correctly i.e. it is nontrivial to program the code that computes the derivative information.
- The algorithm employed for nonlinear optimization problems is not as good as the one employed for conic problems i.e. conic problems has special that can be exploited to make the optimizer faster and more robust.
- The specification of nonlinear problems requires C function callbacks. Such C function callbacks cannot be dump to disk and that makes it hard to report issues to **MOSEK** support.

This leads to following advices in decreasing order of importance.

1. Consider reformulating the problem to a conic quadratic optimization problem if at all possible. In particular many problems involving polynomial terms can easily be reformulated to conic quadratic form.
2. Consider reformulating the problem to a separable optimization problem because that simplifies the issue with verifying convexity and computing 1st and 2nd order derivatives significantly. In most cases problems on separable form also solves faster because of the simpler structure of the functions.
3. Finally, if the problem cannot be reformulated to separable form then use a modelling language like AMPL or GAMS. The reason is the modeling language will do all the computing of function values and derivatives. This eliminates an important source of errors. Therefore, it is strongly recommended to use a modelling language at the prototype stage.

The following tutorials are provided in this section:

- *The Separable Convex interface (SCopt)*
- *Exponential optimization*
- *Dual geometric optimization*
- *General convex optimization*

4.1 Separable Convex (SCopt) Interface

The **MOSEK** optimizer API provides a way to add simple non-linear functions composed from a limited set of non-linear terms. Non-linear terms can be mixed with quadratic terms in objective and constraints.

We consider a normal linear problem with additional non-linear terms z :

$$\begin{array}{llll} \text{minimize} & & z_0(x) + c^T x & \\ \text{subject to} & l_i^c & \leq & z_i(x) + a_i^T x \leq u_i^c, \quad i = 1 \dots m \\ & l^x & \leq & x \leq u^x, \\ & x \in \mathbb{R}^n & z : \mathbb{R}^n \rightarrow \mathbb{R}^{(m+1)} & \end{array}$$

Using the separable non-linear interface it is possible to add non-linear functions of the form

$$z_i(x) = \sum_{k=1}^{K_i} w_k^i(x_{p_{ik}}), \quad w_k^i : \mathbb{R} \rightarrow \mathbb{R}$$

In other words, each non-linear function z_i is a sum of separable functions w_k^i of one variable each. A limited set of functions are supported; each w_k^i can be one of the separable functions:

Table 4.1: Functions supported by the SCopt interface.

Separable function	Operator name	
$f x \ln(x)$	<i>ent</i>	Entropy function
$f e^{g x + h}$	<i>exp</i>	Exponential function
$f \ln(g x + h)$	<i>log</i>	Logarithm
$f(x + h)^g$	<i>pow</i>	Power function

where f , g and h are constants.

This formulation does not guarantee convexity. For **MOSEK** to be able to solve the problem, following requirements must be met:

- If the objective is minimized, the sum of non-linear terms must be convex, otherwise it must be concave.
- Any constraint bounded below must be concave, and any constraint bounded above must be convex.
- Each separable term must be twice differentiable within the bounds of the variable it is applied to.

If these are not satisfied **MOSEK** may not be able to solve the problem or produce a meaningful status report. For details see Section 4.1.1.

Important: When to use the SCopt API:

- When conic can absolutely not be used.
- when a conic formulation would be significantly larger

Problems: less stable, less predictable, harder to debug, worse status info

4.1.1 Ensuring Convexity and Differentiability

Some simple rules can be set up to ensure that the problem satisfies **MOSEK**'s convexity and differentiability requirements. First of all, for any variable x_i used in a separable term, the variable bounds must define a range within which the function is twice differentiable.

We can define these bounds as follows:

Separable function	Operator name	Safe x bounds
$f x \ln(x)$	<i>ent</i>	$0 < x$.
$f e^{g x + h}$	<i>exp</i>	$-\infty < x < \infty$.
$f \ln(g x + h)$	<i>log</i>	If $g > 0$: $-h/g < x$.
		If $g < 0$: $x < -h/g$.
$f(x + h)^g$	<i>pow</i>	If $g > 0$ and integer: $-\infty < x < \infty$.
		If $g < 0$ and integer: either $-h < x$ or $x < -h$.
		Otherwise: $-h < x$.

To ensure convexity, we require that each $z_i(x)$ is either a sum of convex terms or a sum of concave terms. The following table lists convexity for the relevant ranges for $f > 0$ — changing the sign of f switches concavity/convexity.

Separable function	Operator name	Convexity conditions
$f x \ln(x)$	<i>ent</i>	Convex within safe bounds.
$f e^{gx+h}$	<i>exp</i>	Convex for all x .
$f \ln(gx + h)$	<i>log</i>	Concave within safe bounds.
$f(x + h)^g$	<i>pow</i>	If g is even integer: convex within safe bounds.
		If g is odd integer: <ul style="list-style-type: none"> • concave if $(-\infty, -h)$, • convex if $(-h, \infty)$
		If $0 < g < 1$: concave within safe bounds.
		Otherwise: convex within safe bounds.

4.1.2 SCopt Example

Subsequently, we will use the following example to demonstrate the solution of a separable convex optimization problem using **MOSEK**

$$\begin{aligned}
 & \text{maximize} && \exp(x_2) - \ln(x_1) \\
 & \text{subject to} && x_2 \ln(x_2) \geq 0 \\
 & && x_1^{\sqrt{2}} - x_2 \leq 0 \\
 & && x_1, x_2 \geq \frac{1}{2}.
 \end{aligned} \tag{4.1}$$

This problem is obviously separable. Moreover, note that all nonlinear functions are well defined for x values satisfying the variable bounds strictly, i.e.

$$x_1, x_2 > 0.$$

This assures that function evaluation errors will not occur during the optimization process because **MOSEK** will only evaluate $\ln(x_1)$ and $x_2 \ln(x_2)$ for $x_1, x_2 > 0$.

The method employed above can often be used to make convex optimization problems separable even if these are not formulated as such initially. The reader might object that this approach is inefficient because additional constraints and variables are introduced to make the problem separable. However, in our experience this drawback is offset largely by the much simpler structure of the nonlinear functions. Particularly, the evaluation of the nonlinear functions, their gradients and Hessians is much easier in the separable case.

TBD

4.2 Exponential Optimization

4.2.1 Problem Definition

An exponential optimization problem has the form

$$\begin{aligned}
 & \text{minimize} && \sum_{k \in J_0} c_k e^{\{\sum_{j=0}^{n-1} a_{k,j} x_j\}} \\
 & \text{subject to} && \sum_{k \in J_i} c_k e^{\{\sum_{j=0}^{n-1} a_{k,j} x_j\}} \leq 1, \quad i = 1, \dots, m, \\
 & && x \in \mathbb{R}^n
 \end{aligned} \tag{4.2}$$

where it is assumed that

$$\bigcup_{i=0}^m J_i = \{1, \dots, T\}$$

and

$$J_i \cap J_j = \emptyset$$

if $i \neq j$.

Given

$$c_i > 0, \quad i = 1, \dots, T$$

the problem (4.2) is a convex optimization problem which can be solved using **MOSEK**. We will call

$$c_t e^{\{\sum_{j=0}^{n-1} a_{t,j} x_j\}} = e^{\{\log(c_t) + \sum_{j=0}^{n-1} a_{t,j} x_j\}}$$

for a term and hence the number of terms is T .

As stated the problem (4.2) is a nonseparable problem. However, using

$$v_t = \log(c_t) + \sum_{j=0}^{n-1} a_{t,j} x_j$$

we obtain the separable problem

$$\begin{aligned} & \text{minimize} && \sum_{t \in J_0} e^{v_t} \\ & \text{subject to} && \sum_{t \in J_i} e^{v_t} \leq 1, && i = 1, \dots, m, \\ & && \sum_{j=0}^{n-1} a_{t,j} x_j - v_t = -\log(c_t), && t = 0, \dots, T. \end{aligned} \tag{4.3}$$

A warning about this approach is that computing the function

$$e^x$$

using double-precision floating point numbers is only possible for small values of x in absolute value. Indeed e^x grows very rapidly for larger x values, and numerical problems may arise when solving the problem on this form.

It is also possible to reformulate the exponential optimization problem (4.2) as a dual geometric geometric optimization problem, see Section 4.3. This is often the preferred solution approach because it is computationally more efficient and the numerical problems associated with evaluating e^x for moderately large x values are avoided.

4.2.2 A Warning About Exponential Optimization Problems

Exponential optimization problem may in some cases have a final optimal objective value for a solution containing infinite values. Consider the simple example

$$\begin{aligned} & \text{minimize} && e^x \\ & \text{such that} && x \in \mathbb{R}, \end{aligned}$$

which has the optimal objective value 0 at $x = -\infty$. Similar problems can occur in constraints.

Such a solution can not in general be obtained by numerical methods, which means that **MOSEK** will act unpredictably in these situations — possibly failing to find a meaningful solution or simply stalling.

4.2.3 Source Code

The **MOSEK** distribution includes the source code for a program that enables you to:

- Read (and write) a data file stating an exponential optimization problem.
- Verify that the input data is reasonable.
- Solve the problem via the exponential optimization problem (4.3) or the dual geometric optimization problem, as in 4.3.
- Write a solution file.

4.2.4 Solving from the Command Line.

In the following we will discuss the program `mskexpopt`, which is included in the **MOSEK** distribution, in both source code and compiled form. Hence, you can solve exponential optimization problems using the operating system command line or directly from your own C program.

The Input Format

First we will define a text input format for specifying an exponential optimization problem. This is as follows:

```
*Thisisacomment
numcon
numvar
numter
c1
c2
⋮
cnumter
i1
i2
⋮
inumter
t1           j1   at1,j1
t2           j2   at2,j2
⋮             ⋮     ⋮
```

The first line is an optional comment line. In general everything occurring after a `*` is considered a comment. Lines 2 to 4 inclusive define the number of constraints (m), the number of variables (n), and the number of terms T in the problem. Then follows three sections containing the problem data.

The first section

```
c1
c2
⋮   cnumter
```

lists the coefficients c_t of each term t in their natural order.

The second section

```
i1
i2
⋮
inumter
```

specifies to which constraint each term belongs. Hence, for instance $i_2 = 5$ means that the term number 2 belongs to constraint 5. $i_t = 0$ means that term number t belongs to the objective.

The third section

```
t1  j1  at1,j1
t2  j2  at2,j2
⋮    ⋮    ⋮
```

defines the non-zero $a_{t,j}$ values. For instance the entry

```
1  3  3.3
```

implies that $a_{t,j} = 3.3$ for $t = 1$ and $j = 3$.

Please note that each $a_{t,j}$ should be specified only once.

4.2.5 Choosing Primal or Dual Form

One can choose to solve the exponential optimization problem directly in the primal form (4.3) or on the dual form. By default `mskexpopt` solves a problem on the dual form since usually this is more efficient. The command line option

`-primal`

chooses the primal form.

4.2.6 An Example

Consider the problem:

$$\begin{aligned} \text{minimize} \quad & 40e^{-x_1 - \frac{1}{2}x_2 - x_3} + 20e^{x_1 + x_3} + 40e^{x_1 + x_2 + x_3} \\ \text{subject to} \quad & \frac{1}{3}e^{-2x_1 - 2x_2} + \frac{4}{3}e^{\frac{1}{2}x_2 - x_3} \leq 1. \end{aligned} \tag{4.4}$$

This small problem can be specified using the input format shown in [Listing 4.1](#).

Listing 4.1: Input file to specify problem (4.4).

```
* File : expopt1.eo

1  * numcon
3  * numvar
5  * numter

* Coefficients of terms

40
20
40
0.3333333
1.3333333

* For each term, the index of the
* constraints to the term belongs

0
0
0
1
1

* Section defining a_kj

0 0 -1

2 1 1.0
2 2 1.0
3 0 -2
3 1 -2
4 1 0.5
4 2 -1.0
```

Using the program `mskexpopt` included in the **MOSEK** distribution the example can be solved. Indeed the command line

```
mskexpopt expopt1.eo
```

will produce the solution file `expopt1.sol` shown below.

```

2      -6.931472e-01
3      3.465736e-01
```

4.2.7 Solving From Your C Code

The C source code for solving an exponential optimization problem is included in the **MOSEK** distribution. The relevant source code consists of the files:

`expopt.h`

Defines prototypes for the functions:

- `MSK_expoptread`: Reads a problem from a file.
- `MSK_expoptsetup`: Sets up a problem. The function takes the arguments:
 - `expopttask`: A **MOSEK** task structure.
 - `solveform`: If 0, then the optimizer will choose whether the problem is solved on primal or dual form. If -1 the primal form is used and if 1 the dual form.
 - `numcon`: Number of constraints.
 - `numvar`: Number of variables.
 - `numter`: Number of terms T .
 - `*subi`: Array of length `numter` defining which constraint a term belongs to or zero for the objective.
 - `*c`: Array of length `numter` containing coefficients for the terms.
 - `numanz`: Length of `subk`, `subj`, and `akj`.
 - `*subk`: Term indexes.
 - `*subj`: Variable indexes.
 - `*akj`: `akj[i]` is coefficient of variable `subj[i]` in term `subk[i]`, i.e.

$$a_{\text{subk}[i], \text{subj}[i]} = \text{akj}[i].$$

- `*expopthnd`: Data structure containing nonlinear information.
- `MSK_expoptimize`: Solves the problem and returns the problem status and the optimal primal solution.
- `MSK_expoptfree`: Frees data structures allocated by `MSK_expoptsetup`.

expopt.c

Implements the functions specified in expopt.h.

mskexpopt.c

A command line interface.

As a demonstration of the interface a C program that solves (4.4) is included below.

```
#include <string.h>

#include "expopt.h"

void MSKAPI printcb(void* handle, const char str[])
{
    printf("%s",str);
}

int main (int argc, char **argv)
{
    int            r = MSK_RES_OK, numcon = 1, numvar = 3 , numter = 5;

    int            subi[]   = {0,0,0,1,1};
    int            subk[]   = {0,0,0,1,1,2,2,2,3,3,4,4};
    double         c[]      = {40.0,20.0,40.0,0.333333,1.333333};
    int            subj[]  = {0,1,2,0,2,0,1,2,0,1,1,2};
    double         akj[]    = {-1,-0.5,-1.0,1.0,1.0,1.0,1.0,1.0,-2.0,-2.0,0.5,-1.0};
    int            numanz   = 12;
    double         objval;
    double         xx[3];
    double         y[5];
    MSKenv_t       env;
    MSKprostaes    prosta;
    MSKsolstaes    solsta;
    MSKtask_t      expopttask;
    expopthand_t   expopthnd = NULL;
    /* Pointer to data structure that holds nonlinear information */

    if (r == MSK_RES_OK)
        r = MSK_makeenv (&env,NULL);

    if (r == MSK_RES_OK)
        MSK_makeemptytask(env,&expopttask);

    if (r == MSK_RES_OK)
        r = MSK_linkfunctotaskstream(expopttask,MSK_STREAM_LOG,NULL,printcb);

    if (r == MSK_RES_OK)
    {
        /* Initialize expopttask with problem data */
        r = MSK_exoptsetup(expopttask,
                           1, /* Solve the dual formulation */
                           numcon,
                           numvar,
                           numter,
                           subi,
                           c,
                           subk,
                           subj,
                           akj,
```

```

        numanz,
        &expopthnd
        /* Pointer to data structure holding nonlinear data */
    );
}

/* Any parameter can now be changed with standard mosek function calls */
if (r == MSK_RES_OK)
    r = MSK_putintparam(expopttask,MSK_IPAR_INTPNT_MAX_ITERATIONS,200);

/* Optimize, xx holds the primal optimal solution,
   y holds solution to the dual problem if the dual formulation is used
   */

if (r == MSK_RES_OK)
    r = MSK_expoptimize(expopttask,
                        &prosta,
                        &solsta,
                        &objval,
                        xx,
                        y,
                        &expopthnd);

/* Free data allocated by expoptsetup */
if (expopthnd)
    MSK_expoptfree(expopttask,
                   &expopthnd);

MSK_deletetask(&expopttask);
MSK_deleteenv(&env);
}

```

4.3 Dual Geometric Optimization

Dual geometric is a special class of nonlinear optimization problems involving a nonlinear and non-separable objective function. In this section we will show how to solve dual geometric optimization problems using **MOSEK**.

4.3.1 Problem Definition

Consider the dual geometric optimization problem

$$\begin{aligned}
 &\text{maximize} && f(x) \\
 &\text{subject to} && Ax = b, \\
 & && x \geq 0,
 \end{aligned}$$

where $A \in \mathbb{R}^{m \times n}$ and all other quantities have conforming dimensions. Let t be an integer and p be a vector of $t + 1$ integers satisfying the conditions

$$\begin{aligned}
 p_0 &= 0, \\
 p_i &< p_{i+1}, \quad i = 1, \dots, t, \\
 p_t &= n.
 \end{aligned}$$

Then f can be stated as follows

$$f(x) = \sum_{j=0}^{n-1} x_j \ln \left(\frac{v_j}{x_j} \right) + \sum_{i=1}^t \left(\sum_{j=p_i}^{p_{i+1}-1} x_j \right) \ln \left(\sum_{j=p_i}^{p_{i+1}-1} x_j \right)$$

where $v \in \mathbb{R}^n$ is a vector positive values.

Given these assumptions, it can be proven that f is a concave function and therefore the dual geometric optimization problem can be solved using **MOSEK**.

For a thorough discussion of geometric optimization see [BSS93].

We will introduce the following definitions:

$$x^i := \begin{bmatrix} x_{p_i} \\ x_{p_i+1} \\ \vdots \\ x_{p_{i+1}-1} \end{bmatrix}, X^i := \text{diag}(x^i), \text{ and } e^i := \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix} \in \mathbb{R}^{p_{i+1}-p_i}.$$

which make it possible to state f on the form

$$f(x) = \sum_{j=0}^{n-1} x_j \ln \left(\frac{v_j}{x_j} \right) + \sum_{i=1}^t ((e^i)^T x^i) \ln ((e^i)^T x^i).$$

Furthermore, we have that

$$\nabla f(x) = \begin{bmatrix} \ln(v_0) - 1 - \ln(x_0) \\ \vdots \\ \ln(v_j) - 1 - \ln(x_j) \\ \vdots \\ \ln(v_{n-1}) - 1 - \ln(x_{n-1}) \end{bmatrix} + \begin{bmatrix} 0e^0 \\ (1 + \ln((e^1)^T x^1))e^1 \\ \vdots \\ (1 + \ln((e^i)^T x^i))e^i \\ \vdots \\ (1 + \ln((e^t)^T x^t))e^t \end{bmatrix}$$

and

$$\nabla^2 f(x) = \begin{bmatrix} -(X^0)^{-1} & 0 & 0 & \cdots & 0 \\ 0 & \frac{e^1(e^1)^T}{(e^1)^T x^1} - (X^1)^{-1} & 0 & \cdots & 0 \\ 0 & 0 & \ddots & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & \frac{e^t(e^t)^T}{(e^t)^T x^t} - (X^t)^{-1} \end{bmatrix}.$$

Please note that the Hessian is a block diagonal matrix and, especially if t is large, it is very sparse — **MOSEK** will automatically exploit these features to speed up computations. Moreover, the Hessian can be computed cheaply, specifically in

$$O\left(\sum_{i=0}^t (p_{i+1} - p_i)^2\right)$$

operations.

4.3.2 A Numerical Example

In the following we will use the data

$$A = \begin{bmatrix} -1 & 1 & 1 & -2 & 0 \\ -0.5 & 0 & 1 & -2 & 0.5 \\ -1 & 1 & 1 & 0 & -1 \\ 1 & 1 & 1 & 0 & 0 \end{bmatrix}, b = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}, v = \begin{bmatrix} 40 \\ 20 \\ 40 \\ \frac{1}{3} \\ \frac{3}{3} \end{bmatrix}$$

and the function f given by

$$f(x) = \sum_{j=0}^4 x_j \ln \left(\frac{v_j}{x_j} \right) + (x_3 + x_4) \ln(x_3 + x_4)$$

for demonstration purposes.

4.3.3 dgopt: A Program for Dual Geometric Optimization

The generic dual geometric optimization problem and a numerical example have been presented and we will now develop a program which can solve the dual geometric optimization problem using the **MOSEK** API.

Data Input

The first problem is how to feed the problem data into **MOSEK**. Since the constraints of the optimization problem are linear, they can be specified fully using an MPS file as in the purely linear case. The MPS file for the numerical data above will look as follows:

```

NAME
ROWS
  N  obj
  E  c1
  E  c2
  E  c3
  E  c4
COLUMNS
  x1      obj      0
  x1      c1       -1
  x1      c2      -0.5
  x1      c3       -1
  x1      c4        1
  x2      obj      0
  x2      c1        1
  x2      c3        1
  x2      c4        1
  x3      obj      0
  x3      c1        1
  x3      c2        1
  x3      c3        1
  x3      c4        1
  x4      obj      0
  x4      c1       -2
  x4      c2       -2
  x5      obj      0
  x5      c2       0.5
  x5      c3       -1
RHS
  rhs      c4      1
RANGES
BOUNDS
ENDATA

```

Moreover, a file specifying f is required so for that purpose we define a file:

$$\begin{array}{c}
 t \\
 v_0 \\
 v_1 \\
 \vdots \\
 v_{n-1} \\
 p_1 - p_0 \\
 p_2 - p_1 \\
 \vdots \\
 p_t - p_{t-1}
 \end{array}$$

Hence, for the numerical example this file has the format:

```
2
40.0
20.0
40.0
0.3333333333333333
1.3333333333333333
3
2
```

Solving the Numerical Example

The example is solved by executing the command line

```
mskdgopt examp/data/dgo.mps examples/data/dgo.f
```

4.3.4 The Source Code: dgopt

The source code for the **dgopt** consists of the files:

- **dgopt.h** and **dgopt.c**: Functions for reading and solving the dual geometric optimization problem.
- **mskdgopt.c** : The command line interface.

These files are available in the **MOSEK** distribution in the directory **tools/examples/c**.

The basic functionality of **dgopt** can be gathered by studying the function **main** in **mskdgopt.c**. This function first loads the linear part of the problem from an MPS file into the task. Next, the nonlinear part of the problem is read from a file with the function **MSK_dgoptread**. Finally, the nonlinear function is created and inputted with **MSK_dgoptsetup** and the problem is solved. The solution is written to the file **dgopt.sol**.

The following functions in **dgopt.c** are used to set up the information about the evaluation of the nonlinear objective function:

- **MSK_dgoread** - The purpose of this function is to read data from a file which specifies the nonlinear function f in the objective.
- **MSK_dgosetup** - This function creates the problem in the task. The information parsed to the function is stored in a data structure called **nlhandt**, defined in the program. This structure is later passed to the functions **gostruc** and **goeval** which are used to compute the gradient and the Hessian of f .
- **gostruc** This function is a call-back function used by **MOSEK**. The function reports structural information about f such as the number of non-zeros in the Hessian and the sparsity pattern of the Hessian.
- **goeval** This function is a call-back function used by **MOSEK**. It reports numerical information about f such as the objective value and gradient for a particular x value.

4.4 General Convex Optimization

MOSEK provides an interface for general convex optimization which is discussed in this section.

Warning: Using the general convex optimization interface in **MOSEK** is complicated. It is recommended to use the conic solver, the quadratic solver or the **scopt** interface whenever possible. Alternatively GAMS or AMPL with **MOSEK** as solver are well-suited for general convex optimization problems.

4.4.1 The problem

A general nonlinear convex optimization problem is to minimize or maximize an objective function of the form

$$f(x) + \frac{1}{2} \sum_{i=0}^{n-1} \sum_{j=0}^{n-1} q_{i,j}^o x_i x_j + \sum_{j=0}^{n-1} c_j x_j + c^f$$

subject to the functional constraints

$$l_k^c \leq g_k(x) + \frac{1}{2} \sum_{i=0}^{n-1} \sum_{j=0}^{n-1} q_{i,j}^k x_i x_j + \sum_{j=0}^{n-1} a_{k,j} x_j \leq u_k^c, \quad k = 0, \dots, m-1,$$

and the bounds

$$l_j^x \leq x_j \leq u_j^x, \quad j = 0, \dots, n-1.$$

Please note that this problem is a generalization of linear and quadratic optimization. This implies that the parameters c , A , Q^o , Q , and so forth denote the same as in the case of linear and quadratic optimization. All linear and quadratic terms should be inputted to **MOSEK** as described for these problem classes. The general convex part of the problems is defined by the functions $f(x)$ and $g_k(x)$, which must be general nonlinear, twice differentiable functions.

4.4.2 Assumptions About a Nonlinear Optimization Problem

MOSEK makes two assumptions about the optimization problem.

The first assumption is that all functions are at least twice differentiable on their domain. More precisely, $f(x)$ and $g(x)$ must be at least twice differentiable for all x so that

$$l^x < x < u^x.$$

The second assumption is that

$$f(x) + \frac{1}{2} x^T Q^o x$$

must be a convex function if the objective is minimized. Otherwise if the objective is maximized it must be a concave function. Moreover,

$$g_k(x) + \frac{1}{2} x^T Q^k x$$

must be a convex function if

$$u_k^c < \infty$$

and a concave function if

$$l_k^c > -\infty.$$

Note in particular that nonlinear equalities are not allowed. **If these two assumptions are not satisfied, then it cannot be guaranteed that MOSEK produces correct results or works at all.**

4.4.3 Specifying General Convex Terms

MOSEK receives information about the general convex terms via two call-back functions implemented by the user:

- `nlgetspfunc`: For parsing information on structural information about f and g .
- `nlgetvafunc`: For parsing information on numerical information about f and g .

The call-back functions are passed to **MOSEK** with the function `task.putnlfunc`.

For an example of using the general convex framework see Section 4.3.

ADVANCED TUTORIALS

5.1 The Progress Call-back

Some of the API function calls, notably `task.optimize`, may take a long time to complete. Therefore, during the optimization a call-back function is called frequently, to provide information on the progress of the call. From the call-back function it is possible

- to obtain information on the solution process,
- to report of the optimizer's progress, and
- to ask **MOSEK** to terminate, if desired.

The call-back function arguments provide the following information:

- a code that identify the event that caused the call-back to be called,
- an handle to a user-defined data structure and
- the complete set of parameters used by the solver.

The user can force the solver to stop using the return value of the call-back.

Listing 5.1 shows how the progress call-back function can be used.

Listing 5.1: Progress call back example

```
#include <stdio.h>

5.2 Solving Linear Systems Involving the Basis Matrix

A linear optimization problem always has an optimal solution which is also a basic solution. In an optimal basic solution there are exactly m basic variables where m is the number of rows in the constraint matrix A . Define

$$B \in \mathbb{R}^{m \times m}$$

as a matrix consisting of the columns of A corresponding to the basic variables.

The basis matrix B is always non-singular, i.e.

$$\det(B) \neq 0$$

or equivalently that B^{-1} exists. This implies that the linear systems

$$B\bar{x} = w \tag{5.1}$$

and

$$B^T \bar{x} = w \tag{5.2}$$

each has a unique solution for all w .

MOSEK provides functions for solving the linear systems (5.1) and (5.2) for an arbitrary w .

In the next sections we will show how to use **MOSEK** to

- *identify the solution basis,*
- *solve arbitrary linear systems.*

5.2.1 Identifying the Basis

To use the solutions to (5.1) and (5.2) it is important to know how the basis matrix B is constructed.

Internally **MOSEK** employs the linear optimization problem

$$\begin{array}{ll} \text{maximize} & c^T x \\ \text{subject to} & Ax - x^c = 0, \\ & l^x \leq x \leq u^x, \\ & l^c \leq x^c \leq u^c. \end{array} \quad (5.3)$$

where

$$x^c \in \mathbb{R}^m \text{ and } x \in \mathbb{R}^n.$$

The basis matrix is constructed of m columns taken from

$$\begin{bmatrix} A & -I \end{bmatrix}.$$

If variable x_j is a basis variable, then the j 'th column of A denoted $a_{:,j}$ will appear in B . Similarly, if x_i^c is a basis variable, then the i 'th column of $-I$ will appear in the basis. The ordering of the basis variables and therefore the ordering of the columns of B is arbitrary. The ordering of the basis variables may be retrieved by calling the function

```
MSK_initbasissolve(task,basis);
```

where **basis** is an array of variable indexes.

This function initializes data structures for later use and returns the indexes of the basic variables in the array **basis**. The interpretation of the **basis** is as follows. If

$$\text{basis}[i] < \text{numcon},$$

then the i 'th basis variable is x_i^c . Moreover, the i 'th column in B will be the i 'th column of $-I$. On the other hand if

$$\text{basis}[i] \geq \text{numcon},$$

then the i 'th basis variable is variable

$$x_{\text{basis}[i] - \text{numcon}}$$

and the i 'th column of B is the column

$$A_{:,(\text{basis}[i] - \text{numcon})}.$$

For instance if **basis**[0] = 4 and **numcon** = 5, then since **basis**[0] < **numcon**, the first basis variable is x_4^c . Therefore, the first column of B is the fourth column of $-I$. Similarly, if **basis**[1] = 7, then the second variable in the basis is $x_{\text{basis}[1] - \text{numcon}} = x_2$. Hence, the second column of B is identical to $a_{:,2}$.

An example

Consider the linear optimization problem:

$$\begin{array}{ll} \text{minimize} & x_0 + x_1 \\ \text{subject to} & x_0 + 2x_1 \leq 2, \\ & x_0 + x_1 \leq 6, \\ & x_0, x_1 \geq 0. \end{array} \quad (5.4)$$

Suppose a call to `task.initbasissolve` returns an array **basis** so that

```
basis[0] = 1,
basis[1] = 2.
```

Then the basis variables are x_1^c and x_0 and the corresponding basis matrix B is

$$\begin{bmatrix} 0 & 1 \\ -1 & 1 \end{bmatrix}.$$

Please note the ordering of the columns in B .

The program in Listing 5.2 demonstrates the use of `task.solvewithbasis`.

Listing 5.2: A program showing how to identify the basis.

```
#include "mosek.h"

static void MSKAPI printstr(void *handle,
                             const char str[])
{
    printf("%s",str);
} /* printstr */

int main(int argc, const char *argv[])
{
    MSKenv_t      env;
    MSKtask_t     task;
    MSKint32t     numcon=2,numvar=2;
    double        c[]   = {1.0, 1.0};
    MSKint32t     ptrb[] = {0, 2},
    ptre[] = {2, 3};
    MSKint32t     asub[] = {0, 1,
                           0, 1};
    double        aval[] = {1.0, 1.0,
                           2.0, 1.0};
    MSKboundkeye bkc[] = {MSK_BK_UP,
                          MSK_BK_UP};

    double        blc[] = {-MSK_INFINITY,
                          -MSK_INFINITY};
    double        buc[] = {2.0,6.0};

    MSKboundkeye bkc[] = {MSK_BK_LO,MSK_BK_LO};
    double        blx[] = {0.0,0.0};
    double        bux[] = {+MSK_INFINITY,+MSK_INFINITY};
    MSKrescodee   r      = MSK_RES_OK;
    MSKint32t     i,nz;
    double        w[] = {2.0,6.0};
    MSKint32t     sub[] = {0,1};
    MSKint32t     *basis;

    if (r == MSK_RES_OK)
        r = MSK_makeenv(&env,NULL);

    if ( r==MSK_RES_OK )
        r = MSK_makeemptytask(env,&task);

    if ( r==MSK_RES_OK )
        MSK_linkfunctotaskstream(task,MSK_STREAM_LOG,NULL,printstr);

    if ( r == MSK_RES_OK)
        r = MSK_inputdata(task,numcon,numvar,numcon,numvar,
                           c,0.0,
                           ptrb, ptre, asub, aval, bkc, blc, buc, bkc, blx, bux);

    if (r == MSK_RES_OK)
        r = MSK_putobjsense(task,MSK_OBJECTIVE_SENSE_MAXIMIZE);
```

```

if (r == MSK_RES_OK)
    r = MSK_optimize(task);

if (r == MSK_RES_OK)
    basis = MSK_calloc(task,numcon,sizeof(MSKint32t));

if (r == MSK_RES_OK)
    r = MSK_initbasissolve(task,basis);

/* List basis variables corresponding to columns of B */
for (i=0;i<numcon && r == MSK_RES_OK;++i)
{
    printf("basis[%d] = %d\n",i,basis[i]);
    if (basis[sub[i]] < numcon)
        printf ("Basis variable no %d is xc%d.\n",i, basis[i]);
    else
        printf ("Basis variable no %d is x%d.\n",i,basis[i] - numcon);
}

nz = 2;
/* solve Bx = w */
/* sub contains index of non-zeros in w.
   On return w contains the solution x and sub
   the index of the non-zeros in x.
*/
if (r == MSK_RES_OK)
    r = MSK_solvewithbasis(task,0,&nz,sub,w);

if (r == MSK_RES_OK)
{
    printf("\nSolution to Bx = w:\n\n");

    /* Print solution and b. */

    for (i=0;i<nz;++i)
    {
        if (basis[sub[i]] < numcon)
            printf ("xc%d = %e\n",basis[sub[i]] , w[sub[i]] );
        else
            printf ("x%d = %e\n",basis[sub[i]] - numcon , w[sub[i]] );
    }
}

/* Solve B^T y = w */
nz = 1; /* Only one element in sub is nonzero. */
sub[0] = 1; /* Only w[1] is nonzero. */
w[0] = 0.0;
w[1] = 1.0;

if (r == MSK_RES_OK)
    r = MSK_solvewithbasis(task,1,&nz,sub,w);

if (r == MSK_RES_OK)
{
    printf("\nSolution to B^T y = w:\n\n");
    /* Print solution and y. */
    for (i=0;i<nz;++i)
        printf ("y%d = %e\n",sub[i] , w[sub[i]] );
}

return ( r );
}/* main */

```

In the example above the linear system is solved using the optimal basis for (5.4) and the original right-hand side of the problem. Thus the solution to the linear system is the optimal solution to the problem. When running the example program the following output is produced.

```
basis[0] = 1
Basis variable no 0 is xc1.
basis[1] = 2
Basis variable no 1 is x0.

Solution to Bx = b:

x0 = 2.000000e+00
xc1 = -4.000000e+00

Solution to B^Tx = c:

x1 = -1.000000e+00
x0 = 1.000000e+00
```

Please note that the ordering of the basis variables is

$$\begin{bmatrix} x_1^c \\ x_0 \end{bmatrix}$$

and thus the basis is given by:

$$B = \begin{bmatrix} 0 & 1 \\ -1 & 1 \end{bmatrix}$$

It can be verified that

$$\begin{bmatrix} x_1^c \\ x_0 \end{bmatrix} = \begin{bmatrix} -4 \\ 2 \end{bmatrix}$$

is a solution to

$$\begin{bmatrix} 0 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} x_1^c \\ x_0 \end{bmatrix} = \begin{bmatrix} 2 \\ 6 \end{bmatrix}.$$

5.2.2 Solving Arbitrary Linear Systems

MOSEK can be used to solve an arbitrary (rectangular) linear system

$$Ax = b$$

using the `task.solvewithbasis` function without optimizing the problem as in the previous example. This is done by setting up an A matrix in the task, setting all variables to basic and calling the `task.solvewithbasis` function with the b vector as input. The solution is returned by the function.

Below we demonstrate how to solve the linear system

$$\begin{bmatrix} 0 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} x_0 \\ x_1 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \end{bmatrix} \quad (5.5)$$

with $b = (1, -2)$ and $b = (7, 0)$.

```
#include "mosek.h"

static void MSKAPI printstr(void *handle,
                           const char str[])
{
```

```

    printf("%s",str);
} /* printstr */

}

b[0] = 7;
bsub[0] = 0;
nz = 1;

if (r == MSK_RES_OK)
    r = MSK_solvewithbasis(task,0,&nz,bsub,b);

if (r == MSK_RES_OK)
{
    printf("\nSolution to Bx = b:\n\n");
    /* Print solution and show correspondents
       to original variables in the problem */
    for (i=0;i<nz;++i)
    {
        if (basis[bsub[i]] < numcon)
            printf("This should never happen\n");
        else
            printf ("x%d = %e\n",basis[bsub[i]] - numcon , b[bsub[i]] );
    }
}

free (basis);
return r;
}

```

The most important step in the above example is the definition of the basic solution using the `task.putsolution` function, where we define the status key for each variable. The actual values of the variables are not important and can be selected arbitrarily, so we set them to zero. All variables corresponding to columns in the linear system we want to solve are set to basic and the slack variables for the constraints, which are all non-basic, are set to their bound.

The program produces the output:

```
Solution to Bx = b:
```

```
x1 = 1
x0 = 3
```

```
Solution to Bx = b:
```

```
x1 = 7
x0 = 7
```

and we can verify that $x_0 = 2, x_1 = -4$ is indeed a solution to (5.5).

5.3 Calling BLAS/LAPACK Routines from MOSEK

Sometimes users need to perform linear algebra operations that involve dense matrices and vectors. Also **MOSEK** uses extensively high-performance linear algebra routines from the BLAS and LAPACK packages and some of this routine are included in the package shipped to the users.

MOSEK makes available to the user some BLAS and LAPACK routines by **MOSEK** functions that

- use **MOSEK** data types and response code;
- keep BLAS/LAPACK naming convention.

Therefore the user can leverage on efficient linear algebra routines, with a simplified interface, with no need for additional packages. In the Table 5.1 we list BLAS functions.

Table 5.1: BLAS routines available.

BLAS Name	MOSEK function	Math Expression
AXPY	<i>env. axpy</i>	$y = \alpha x + y$
DOT	<i>env. dot</i>	$x^T y$
GEMV	<i>env. gemv</i>	$y = \alpha Ax + \beta y$
GEMM	<i>env. gemm</i>	$C = \alpha AB + \beta C$
SYRK	<i>env. syrk</i>	$C = \alpha AA^T + \beta C$

Function from LAPACK are listed in Table 5.2.

Table 5.2: LAPACK functions available from **MOSEK**

LAPACK Name	MOSEK function	Description
POTRF	<i>env. potrf</i>	Cholesky factorization of a semidefinite symmetric matrix
SYEVD	<i>env. syevd</i>	Eigen-values of a symmetric matrix
SYEIG	<i>env. syeig</i>	Eigen-values and eigen-vectors of a symmetric matrix

Click on the **MOSEK** function link to access additional information.

A working example

In Listing 5.3 we provide a simple working example. It has no practical meaning except to show how to call the provided functions and how the input should be organized.

Listing 5.3: A working example on how to call BLAS and LAPACK routines from MOSEK.

```
#include "mosek.h"
void print_matrix(MSKrealt* x, MSKint32t r, MSKint32t c)
{
    MSKint32t i,j;
    for(i=0;i<r;i++)
    {
        for(j=0;j<c;j++)
            printf("%f ",x[j*r + i]);

        printf("\n");
    }
}

int main(int argc, char* argv[])
{
    MSKrescode_t r = MSK_RES_OK;
    MSKenv_t env = NULL;

    const MSKint32t n=3,m=2,k=3;

    MSKrealt alpha=2.0,beta=0.5;
    MSKrealt x[] = {1.0, 1.0, 1.0};
    MSKrealt y[] = {1.0, 2.0, 3.0};
    MSKrealt z[] = {1.0, 1.0};
    MSKrealt A[] = {1.0, 1.0, 2.0,2.0, 3.0, 3.0};
    MSKrealt B[] = {1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0};
    MSKrealt C[] = {1.0, 2.0, 3.0, 4.0, 5.0, 6.0};
    MSKrealt D[] = {1.0, 1.0, 1.0, 1.0};
    MSKrealt Q[] = {1.0, 0.0, 0.0, 2.0};
    MSKrealt v[] = {0.0, 0.0, 0.0};

    MSKrealt xy;

    /* BLAS routines */
    r = MSK_makeenv(&env,NULL);
    printf("n=%d m=%d k=%d\n",m,n,k);
    printf("alpha=%f\n",alpha);
    printf("beta=%f\n",beta);

    r = MSK_dot(env,n,x,y,&xy);
    printf("dot results= %f r=%d\n",xy,r);

    print_matrix(x,1,n);
    print_matrix(y,1,n);

    r = MSK_axpy(env, n, alpha,x,y);
    puts("axpy results is");
    print_matrix(y,1,n);

    r= MSK_gemv(env, MSK_TRANSPOSE_NO, m, n, alpha, A, x, beta,z);
    printf("gemv results is (r=%d) \n",r);
}
```

```

print_matrix(z,1,m);

r = MSK_gemm(env,MSK_TRANSPOSE_NO,MSK_TRANSPOSE_NO,m,n,k,alpha,A,B,beta,C);
printf("gemm results is (r=%d) \n",r);
print_matrix(C,m,n);

r = MSK_syrk(env, MSK_UPLO_LO, MSK_TRANSPOSE_NO, m,k,1., A, beta,D);
printf("syrk results is (r=%d) \n",r);
print_matrix(D,m,m);

/* LAPACK routines*/

r = MSK_potrf(env,MSK_UPLO_LO,m,Q);
printf("potrf results is (r=%d) \n",r);
print_matrix(Q,m,m);

r = MSK_syevg(env,MSK_UPLO_LO,m,Q,v);
printf("syevg results is (r=%d) \n",r);
print_matrix(v,1,m);

r = MSK_syevd(env,MSK_UPLO_LO,m,Q,v);
printf("syevd results is (r=%d) \n",r);
print_matrix(v,1,m);
print_matrix(Q,m,m);

/* Delete the environment and the associated data. */
MSK_deleteenv(&env);

return r;
}

```

5.4 Computing a Sparse Cholesky Factorization

Given a positive semidefinite symmetric matrix

$$A \in \mathbb{R}^{n \times n}$$

then it is well known there exists a matrix L such that

$$A = LL^T.$$

If the matrix L is a lower triangular matrix then it is called a Cholesky factorization.

Given A is positive definite i.e. nonsingular then L is also nonsingular. This implies that the linear equation system

$$Ax = b$$

can be solved by first solving the lower triangular system

$$Ly = b$$

and then the upper triangular system

$$L^T x = y.$$

For this reason only a Cholesky factorization is useful. Therefore, **MOSEK** provides function that can compute a Cholesky factorization of a positive semidefinite matrix. In addition a function for performing solves with a nonsingular lower triangular matrix and its transpose is available.

In practice A may be very large e.g. n is in the range of millions. However, then A is typically sparse which means that most of the elements in A are zero. Fortunately the sparsity can be exploited during computations of the Cholesky factorization to reduce the computational cost. How large the computational savings are is dependent of the position of the zeros. This can be demonstrated using the example

$$A = \begin{bmatrix} 4 & 1 & 1 & 1 \\ 1 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix}. \quad (5.6)$$

Now if we compute a Cholesky factorization with 5 digits of accuracy we obtain

$$\begin{bmatrix} 2.0000 & 0 & 0 & 0 \\ 0.5000 & 0.8660 & 0 & 0 \\ 0.5000 & -0.2887 & 0.8165 & 0 \\ 0.5000 & -0.2887 & -0.4082 & 0.7071 \end{bmatrix}.$$

Next let us permute the rows and columns symmetrically of A i.e. we multiply A by the permutation matrix

$$P = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

as follows

$$PAP^T = \begin{bmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 \\ 1 & 1 & 1 & 4 \end{bmatrix}.$$

Now the Cholesky factorization of

$$PAP^T$$

is

$$L = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 1 & 1 & 1 & 1 \end{bmatrix}.$$

which is sparser than of the original matrix.

Determining a permutation matrix that leads to the sparsest Cholesky factorization or the minimal amount of work is NP hard. Hence the choice of a good permutation can only be determined heuristically using for instance the minimum degree heuristic and variants. The function provided by **MOSEK** for computing a Cholesky factorization has build in a permutation aka. reordering heuristic.

Next let us see how the Cholesky factorization of (5.6) can be computed using **MOSEK**. The complete source code is in [Listing 5.4](#).

Listing 5.4: How to use the sparse Cholesky factorization routine available in **MOSEK**.

```
#include <stdio.h>

#include "mosek.h"

static MSKrescode_e sparsecholesky(MSKenv_t env,
                                   const MSKint32t n,
```

```

        const MSKint32t anzc[],
        const MSKint32t asubc[],
        const MSKint64t aptrc[],
        const MSKrealt  avalc[],
        MSKint32t      **perm,
        MSKrealt       **diag,
        MSKint32t      **lnzc,
        MSKint64t      **lptrc,
        MSKint64t      *lensubnval,
        MSKint32t      **lsubc,
        MSKrealt       **lvalc)
{
    MSKrescodee r;

    r = MSK_computesparsedcholesky(env,
        0,          /* Disable multithreading
                     since the problems are small. */
        1,          /* Permute/reorder to save computational
                     work. */
        1.0e-14,
        n,
        anzc,
        aptrc,

           [1.0 1.0 1.0]
           [1.0 1.0 1.0]

       then compute a sparse Cholesky factorization A. Observe A is NOT
       positive definite.

    */

    printf("\nSecond example with a semidefinite A.\n");

    r = sparsecholesky(env, n, anzc, asubc, aptrc, avalc,
                      &perm, &diag, &lnzc, &lptrc, &lensubnval, &lsubc, &lvalc);

    MSK_freeenv(env, perm);
    MSK_freeenv(env, lnzc);
    MSK_freeenv(env, lsubc);
    MSK_freeenv(env, lptrc);
    MSK_freeenv(env, diag);
    MSK_freeenv(env, lvalc);
}

MSK_deleteenv(&env);

return ( r );
} /* main */

```

Here is the output when running the code

```

Sparse Cholesky computation.

First example with a definite A.
L and D. Length=7
0 perm=3 diag=0.0000e+000 : 1.0000e+000[0] 1.0000e+000[2]
1 perm=2 diag=0.0000e+000 : 1.0000e+000[1] 1.0000e+000[2]
2 perm=0 diag=0.0000e+000 : 1.4142e+000[2] 7.0711e-001[3]
3 perm=1 diag=0.0000e+000 : 7.0711e-001[3]

Solution A x = b

```

```

x[3]: 4.00e+000
x[2]: 3.00e+000
x[0]: 1.00e+000
x[1]: 2.00e+000

Second example with a semidefinite A.
L and D. Length=6
0 perm=0 diag=0.0000e+000 : 1.0000e+000[0] 1.0000e+000[1] 1.0000e+000[2]
1 perm=2 diag=1.0000e-014 : 1.0000e-007[1] 0.0000e+000[2]
2 perm=1 diag=1.0000e-014 : 1.0000e-007[2]

```

From the output the perm array has the value

$$\begin{bmatrix} 3 & 2 & 0 & 1 \end{bmatrix}$$

implying the permutation matrix

$$P = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

has been employed. Now the Cholesky factorization of the permuted matrix is reported to be

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 1 & 1.4142 & 0 \\ 0 & 0 & 0.7071 & 0.7071 \end{bmatrix}$$

using 5 figures of accuracy which can be verified to be correct.

After computing the Cholesky factorization has been computed it is used to solve the linear equation system

$$Ax = b$$

where b is

$$\begin{bmatrix} 13.0 & 3.0 & 4.0 & 5.0 \end{bmatrix}^T.$$

The solution is reported to be

$$\begin{bmatrix} 1 & 2 & 3 & 4 \end{bmatrix}^T$$

which is correct.

The second example in the source code shows what happens if a sparse Cholesky factorization of a semidefinite matrix is computed. The example A is

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \begin{bmatrix} 1 & 1 & 1 \end{bmatrix}^T \quad (5.7)$$

which is a rank 1 matrix. The results is given by

$$PAP^T + D = LL^T$$

where

$$D = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1.0e-14 & 0 \\ 0 & 0 & 1.0e-14 \end{bmatrix},$$

$$L = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1.0e-7 & 0 \\ 1 & 0 & 1.0e-7 \end{bmatrix}$$

and

$$P = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}.$$

Since A is only positive semidefinite i.e. not of full rank then some of diagonal elements of A are boosted to make it truly positive definite. The amount of boosting is given as an argument to the function computing the sparse Cholesky factorization and has been chosen to $1.0e-14$.

Note that

$$PAP^T - LL^T = D$$

where D is a small matrix so the computed Cholesky factorization is exact of slightly perturbed A which in general is the best we hope for given computations are performed finite precision.

We will end this section by a word of caution. Computing a Cholesky factorization of a matrix that is not of full rank and that is not sufficiently well conditioned may lead to incorrect results i.e. a matrix that is indefinite may declared positive semidefinite and vice versa.

5.5 Converting a quadratically constrained problem to conic form

A conic quadratic constraint has the form

$$x \in \mathcal{Q}^n$$

in its most basic form where

$$\mathcal{Q}^n = \left\{ x \in \mathbb{R}^n : x_1 \geq \sqrt{\sum_{j=2}^n x_j^2} \right\}.$$

Alternatively the conic constraint can be represented using a quadratic inequality

$$\sum_{j=2}^n x_j^2 - x_1^2 \leq 0.0 \tag{5.8}$$

and the simple linear inequality

$$x_1 \geq 0.0.$$

Therefore, it is possible to state conic quadratic problems using quadratic inequalities. Some drawbacks of specifying conic quadratic problems using quadratic inequalities are

- the elegant duality theory for conic problems is lost.
- reporting accurate dual information for quadratic inequalities is hard and/or computational expensive.
- the left hand side of (5.8) is nonconvex so the formulation is strictly speaking not convex.
- a computational overhead is introduced when converting the quadratic inequalities to conic form before optimizing.
- modelling directly on conic form usually leads to a better model [And13] i.e. a faster solution time and better numerical properties.

In addition quadratic inequalities can not be used to specify the semidefinite cone or other more general cones than quadratic cone. Despite the drawbacks it is not uncommon to state conic quadratic problems using quadratic inequalities and therefore **MOSEK** has a function that translate certain quadratically constrained problems to conic form. Note that the **MOSEK** interior-point optimizer will do that automatically for convex quadratic problems automatically. So quadratic to conic form conversion is primarily useful for problems having conic quadratic constraints embedded.

MOSEK employs the following form of quadratic problems:

$$\begin{aligned} & \text{minimize} && \frac{1}{2}x^T Q^o x + c^T x + c^f \\ \text{subject to} && \begin{aligned} l_k^c &\leq \frac{1}{2}x^T Q^k x + \sum_{j=0}^{n-1} a_{k,j} x_j &\leq u_k^c, & k = 0, \dots, m-1, \\ l_j^x &\leq x_j &\leq u_j^x, & j = 0, \dots, n-1. \end{aligned} \end{aligned}$$

The reformulation is not unique. The approach followed by **MOSEK** is to introduce additional variables, linear constraints and quadratic cones to obtain a larger but equivalent problem in which the original variables are preserved.

In particular:

- all variables and constraints are kept in the problem,
- for each reformulated quadratic constraint there will be:
 - one rotated quadratic cone for each quadratic constraint,
 - one rotated quadratic cone if the objective function is quadratic,
 - each quadratic constraint will contain no coefficients and upper/lower bounds will be set to $\infty, -\infty$ respectively.

This allows the user to recover the original variable and constraint values, as well as their dual values, with no conversion or additional effort.

Note: `task.toconic` modifies the input task in-place: this means that if the reformulation is not possible, i.e. the problem is not conic representable, the state of the task is in general undefined. The user should consider cloning the original task.

5.5.1 Quadratic Constraint Reformulation

Let us assume we want to convert the following quadratic constraint

$$l \leq \frac{1}{2}x^T Qx + \sum_{j=0}^{n-1} a_j x_j \leq u$$

in conic form. We first check it must hold either $l = -\infty$ or $u = \infty$, otherwise either the constraint can be dropped, or the constraint is not convex. Thus let us consider the case

$$\frac{1}{2}x^T Qx + \sum_{j=0}^{n-1} a_j^T x_j \leq u. \tag{5.9}$$

Introducing an additional variable w such that

$$w = u - \sum_{j=0}^{n-1} a_j^T x_j \tag{5.10}$$

we obtain the equivalent form

$$\begin{aligned} \frac{1}{2}x^T Qx &\leq w, \\ u - \sum_{j=0}^{n-1} a_j^T x_j &= w. \end{aligned}$$

If Q is positive semidefinite, then there exists a matrix F such that

$$Q = FF^T \quad (5.11)$$

and therefore we can write

$$\begin{aligned} \|Fx\|^2 &\leq 2w, \\ u - \sum_{j=0}^{n-1} a_j^T x_j &= w. \end{aligned}$$

Introducing an additional variable $z = 1$, and setting $y = Fx$ we obtain the conic formulation

$$\begin{aligned} (w, z, y) &\in \mathcal{Q}_r, \\ z &= 1. \\ y &= Fx \\ w &= u - \sum_{j=0}^{n-1} a_j^T x_j. \end{aligned} \quad (5.12)$$

Summarizing, for each quadratic constraint involving $t \leq n$ variables, **MOSEK** introduces

1. a rotated quadratic cone of dimension $t + 2$,
2. two additional variables for the cone roots,
3. t additional variables to map the remaining part of the cone,
4. t linear constraints.

5.5.2 Some Examples

We report in this section few examples of reformulation of a QCQP problem in conic form. For each problem we will show its definition before and after the reformulation, using the human-readable *OPF format*.

Quadratic problem

We consider a simple quadratic problem of the form

$$\begin{aligned} \min \quad & \frac{1}{2}(13x_0^2 + 17x_1^2 + 12x_2^2 + 24x_0x_1 + 12x_1x_2 - 4x_0x_2) - 22x_0 - 14.5x_1 + 12x_2 + 1 \\ \text{s.t.} \quad & -1 \leq x_i \leq 1 \quad i = 0, 1, 2 \end{aligned}$$

```
[comment]
An example of small QP from Boyd and Vandenberghe, "Convex Optimization", pag 189 ex 4.3
The solution is (1,0.5,-1)
[/comment]

[variables disallow_new_variables]
x0 x1 x2
[/variables]

[objective min]
0.5 (13 x0^2 + 17 x1^2 + 12 x2^2 + 24 x0 * x1 + 12 x1 * x2 - 4 x0 * x2 ) - 22 x0 - 14.5 x1 + 12 x2 + 1
[/objective]

[bounds]
[b] -1 <= * <= 1 [/b]
[/bounds]
```

The objective function is convex, the solution is attained for $x^* = (1, 0.5, -1)$. The conversion will introduce first a variable x_3 in the objective function such that $x_3 \geq 1/2x^T Qx$ and then convert the latter directly in conic form. The converted problem follows:

$$\begin{aligned}
 \min \quad & -22x_0 - 14.5x_1 + 12x_2 + x_3 + 1 \\
 \text{s.t.} \quad & 3.61x_0 + 3.33x_1 - 0.55x_2 - x_6 = 0 \\
 & +2.29x_1 + 3.42x_2 - x_7 = 0 \\
 & 0.81x_1 - x_8 = 0 \\
 & -x_3 + x_4 = 0 \\
 & x_5 = 1 \\
 & (x_4, x_5, x_6, x_7, x_8) \in \mathcal{Q}_\nabla \\
 & -1 \leq x_0, x_1, x_2 \leq 1
 \end{aligned}$$

The model generated by `task.toconic` is

```

[/bounds]

```

We can clearly see that constraints `c0000` to `c0002` represent the linear mapping as in (5.11), while (5.10) corresponds to `c0003`. The cone roots are `x0005` and `x0004`.

5.6 MOSEK OptServer

MOSEK provides an easy way to offload optimization problem to a remote server in both *synchronous* or *asynchronous* mode. This section describes the functionalities from the client side, i.e. how a user can *send* a given optimization problem to a remote server where a optimization server is listening and will run **MOSEK** to solve the problem.

5.6.1 Synchronous Remote Optimization

In synchronous mode the client send the optimization problem to the optimization server and wait for the optimization to end. Once the result has been received, the program can continue. This is the simplest mode and requires very limited modifications to existing code: instead of `task.optimize` we only need to use `task.optimizermt` instead, passing the host and port on which the server is running and listening.

The rest of the code remains untouched.

Important: There is no way to recover a job in case the connection has been broken!

In Listing 5.5 we show how to modify tutorial in Section 3.1 so that the computation is off loaded to a remote machine.

Listing 5.5: Using the OptServer in synchronous mode.

```
#include "mosek.h"

static void MSKAPI printstr(void *handle, const char str[])
{
    printf("%s",str);
}

int main (int argc, const char * argv[])
{
    MSKenv_t    env  = NULL;
    MSKtask_t   task = NULL;
    MSKrescodee res  = MSK_RES_OK;
    MSKrescodee trm  = MSK_RES_OK;

    if (argc <= 3)
    {
        printf ("Missing argument, syntax is:\n");
        printf ("  opt_server_sync inputfile host port\n");
    }
    else
    {
        // Create the mosek environment.
        // The 'NULL' arguments here, are used to specify customized
        // memory allocators and a memory debug file. These can
        // safely be ignored for now.
        res = MSK_makeenv (&env,NULL);

        // Create a task object linked with the environment env.
        // We create it with 0 variables and 0 constraints initially,
        // since we do not know the size of the problem.
        if ( res==MSK_RES_OK )
            res = MSK_maketask (env, 0, 0, &task);

        // Direct the task log stream to a user specified function
        if ( res==MSK_RES_OK )
            res = MSK_linkfunctotaskstream (task, MSK_STREAM_LOG, NULL, printstr);

        // We assume that a problem file was given as the first command
        // line argument (received in 'argv')
        if ( res==MSK_RES_OK )
            res = MSK_readdata (task, argv[1]);

        // Solve the problem remotely
        if ( res==MSK_RES_OK )
            res = MSK_optimizermt (task, argv[2], argv[3], &trm);
    }
}
```

```

// Print a summary of the solution.
if ( res==MSK_RES_OK )
    res = MSK_solutionsummary (task, MSK_STREAM_LOG);

// If an output file was specified, write a solution
if ( res==MSK_RES_OK && argc >= 3 )
{
    // We define the output format to be OPF, and tell MOSEK to
    // leave out parameters and problem data from the output file.
    MSK_putintparam (task, MSK_IPAR_WRITE_DATA_FORMAT,    MSK_DATA_FORMAT_OP);
    MSK_putintparam (task, MSK_IPAR_OPF_WRITE_SOLUTIONS,  MSK_ON);
    MSK_putintparam (task, MSK_IPAR_OPF_WRITE_HINTS,      MSK_OFF);
    MSK_putintparam (task, MSK_IPAR_OPF_WRITE_PARAMETERS, MSK_OFF);
    MSK_putintparam (task, MSK_IPAR_OPF_WRITE_PROBLEM,    MSK_OFF);

    res = MSK_writedata (task, argv[2]);
}

// Delete task and environment
MSK_deletetask (&task);
MSK_deleteenv (&env);
}
return res;
}

```

5.6.2 Asynchronous Remote Optimization

Working in asynchronous mode involves more steps. In particular once that the optimization has started, the user is responsible to check the status and when optimization ends, fetch the results. The user can also stop the optimization anytime. The relevant functions are:

- `task.asyncgetresult` : Request a response from a remote job.
- `task.asyncoptimize` : Offload the optimization task to a solver server.
- `task.asyncpoll` : Requests information about the status of the remote job.
- `task.asyncstop` : Request that the job identified by the token is terminated.

In Listing 5.6 the code in Listing 5.5 is extended in order to run asynchronously: after that the optimization is started, the program enters in a polling loop that regularly checks whether the result of the optimization is available.

Listing 5.6: Using the OptServer in synchronous mode.

```

#include "mosek.h"
#ifdef WIN32
#include "windows.h"
#else
#include "unistd.h"
#endif

static void MSKAPI printstr(void *handle, const char str[])
{
    printf("%s",str);
}

int main (int argc, char * argv[])
{

```

```
char token[33];

int      numpolls = 10;
int      i=0;

MSKboolean_t respavailable;

MSKenv_t  env  = NULL;
MSKtask_t task = NULL;

MSKrescode_t res  = MSK_RES_OK;
MSKrescode_t trm;
MSKrescode_t resp;

const char * filename = "../data/25fv47.mps";
const char * host      = "karise";
const char * port      = "30080";

if (argc < 5)
{
    fprintf(stderr, "Syntax: opt_server_async filename host port numpolls\n");
    return 0;
}

if (argc > 1) filename = argv[1];
if (argc > 2) host      = argv[2];
if (argc > 3) port      = argv[3];
if (argc > 4) numpolls = atoi(argv[4]);

res = MSK_makeenv (&env, NULL);

if ( res==MSK_RES_OK )
    res = MSK_maketask (env, 0, 0, &task);
if ( res==MSK_RES_OK )
    res = MSK_linkfunctotaskstream (task, MSK_STREAM_LOG, NULL, printstr);

if ( res==MSK_RES_OK )
    res = MSK_readdata (task, filename);

res= MSK_asyncoptimize(task,
                        host,
                        port,
                        token);
MSK_deletetask (&task);
printf("token = %s\n", token);

if ( res==MSK_RES_OK )
    res = MSK_maketask (env, 0, 0, &task);

if ( res==MSK_RES_OK )
    res = MSK_readdata (task, filename);

if ( res==MSK_RES_OK )
    res = MSK_linkfunctotaskstream (task, MSK_STREAM_LOG, NULL, printstr);

for( i=0; i< numpolls &&  res == MSK_RES_OK ; i++)
{
    #if __linux__
        sleep(1);
    #elif defined(_WIN32)
        Sleep(1000);
    #endif
}
```

```

printf("poll %d\n ", i);

res = MSK_asyncpoll( task,
                    host,
                    port,
                    token,
                    &respavailable,
                    &resp,
                    &trm);

puts("polling done");

if(respavailable)
{
    puts("solution available!");
    res = MSK_asyncgetresult(task,
                            host,
                            port,
                            token,
                            &respavailable,
                            &resp,
                            &trm);

    MSK_solutionsummary (task, MSK_STREAM_LOG);
    break;
}
}

if(i == numpolls)
{
    printf("max num polls reached, stopping %s", host);
    MSK_asyncstop (task, host, port, token);
}

MSK_deletetask (&task);

MSK_deleteenv (&env);
printf("%s:%d: Result = %d\n", __FILE__, __LINE__, res); fflush(stdout);

return res;
}

```

GUIDELINES

6.1 Deployment

When redistributing a C application using the **MOSEK** Optimizer API for C 8.0.0.94, the following libraries must be included:

64-bit Linux	64-bit Windows	32-bit Windows	64-bit Mac OS
libmosek64.so.8.0	mosek64_8_0.dll	mosek32_8_0.dll	libmosek64.dylib.8.0
libiomp5.lib	libomp5md.dll	libomp5md.dll	libiomp5.dylib
libcilkrts.so.5	cilkrts20.dll	cilkrts20.dll	libcilkrts.5.dylib

6.2 Efficiency Considerations

Although **MOSEK** is implemented to handle memory efficiently, the user may have valuable knowledge about a problem, which could be used to improve the performance of **MOSEK**. This section discusses some tricks and general advice that hopefully make **MOSEK** process your problem faster.

Avoiding memory fragmentation

MOSEK stores the optimization problem in internal data structures in the memory. Initially **MOSEK** will allocate structures of a certain size, and as more items are added to the problem the structures are reallocated. For large problems the same structures may be reallocated many times causing memory fragmentation. One way to avoid this is to give **MOSEK** an estimated size of your problem using the functions:

- *task.putmaxnumvar*. Estimate for the number of variables.
- *task.putmaxnumcon*. Estimate for the number of constraints.
- *task.putmaxnumcone*. Estimate for the number of cones.
- *task.putmaxnumbarvar*. Estimate for the number of semidefinite matrix variables.
- *task.putmaxnumanz*. Estimate for the number of non-zeros in A .
- *task.putmaxnumqnz*. Estimate for the number of non-zeros in the quadratic terms.

None of these functions change the problem, they only give hints to the eventual dimension of the problem. If the problem ends up growing larger than this, the estimates are automatically increased.

Do not mix put- and get- functions

For instance, the functions *task.putacol* and *task.getacol*. **MOSEK** will queue put- commands internally until a get- function is called. If every put- function call is followed by a get- function call, the queue will have to be flushed often, decreasing efficiency.

In general `get-` commands should not be called often during problem setup.

Use the LIFO principle

When removing constraints and variables, try to use a LIFO approach, i.e. Last In First out. **MOSEK** can more efficiently remove constraints and variables with a high index than a small index.

An alternative to removing a constraint or a variable is to fix it at 0, and set all relevant coefficients to 0. Generally this will not have any impact on the optimization speed.

Add more constraints and variables than you need (now)

The cost of adding one constraint or one variable is about the same as adding many of them. Therefore, it may be worthwhile to add many variables instead of one. Initially fix the unused variable at zero, and then later unfix them as needed. Similarly, you can add multiple free constraints and then use them as needed.

Do not remove basic variables

When doing re-optimizations, instead of removing a basic variable it may be more efficient to fix the variable at zero and then remove it when the problem is re-optimized and it has left the basis. This makes it easier for **MOSEK** to restart the simplex optimizer.

Use one environment (`env`) only

If possible share the environment (`env`) between several tasks. For most applications you need to create only a single `env`.

6.3 The license system

MOSEK is a commercial product that **always** needs a valid license to work. A license is typically provided as a license file that allows the user to access the subset of the **MOSEK** Optimization Suite functionalities it is entitled for, and for the right amount of time. **MOSEK** uses a third party license manager to implement license checking.

By default a license token remains checked out for the duration of the **MOSEK** session, i.e.

1. a license token is checked out when `task.optimize` is first called and
2. it is returned when the **MOSEK** environment is deleted.

Calling `task.optimize` from different threads using the same **MOSEK** environment only consumes one license token.

To change the license systems behavior to returning the license token after each call to **MOSEK** set the parameter `MSK_IPAR_CACHE_LICENSE` to `MSK_OFF`.

Additionally license checkout and checkin can be controlled manually with the functions `env.checkinlicense` and `env.checkoutlicense`.

6.3.1 Waiting for a free license

By default an error will be returned if no license token is available. By setting the parameter `MSK_IPAR_LICENSE_WAIT` **MOSEK** can be instructed to wait until a license token is available.

6.3.2 Manually stopping the license system

Usually the license system is stopped automatically when the **MOSEK** library is unloaded. However, when the user explicitly unload the library using e.g windows `FreeLibrary`, the license system must be stopped before the library is unloaded. This can be done by calling the function *`env.licensecleanup`* as the last function call to **MOSEK**.

CASE STUDIES

In this section we present some case studies in which the Optimizer API for C is used to solve real-life applications. These examples involve some more advanced modeling skills and possibly some input data. The user is strongly recommended to first read the *basic tutorials* before going through these advanced case studies.

Case Studies	Type	Int.	Keywords
<i>Portfolio Optimization</i>	CQO	NO	Markowitz, Slippage, Market Impact

7.1 Portfolio Optimization

In this section the Markowitz portfolio optimization problem and variants are implemented using the **MOSEK** optimizer API.

Subsequently the following MATLAB inspired notation will be employed. The $:$ operator is used as follows

$$i:j = \{i, i+1, \dots, j\}$$

and hence

$$x_{2:4} = \begin{bmatrix} x_2 \\ x_3 \\ x_4 \end{bmatrix}$$

If x and y are two column vectors, then

$$[x; y] = \begin{bmatrix} x \\ y \end{bmatrix}$$

Furthermore, if $f \in \mathbb{R}^{m \times n}$ then

$$f(:,) = \begin{bmatrix} f_{1,1} \\ f_{2,1} \\ \vdots \\ f_{m-1,n} \\ \vdots \\ f_{m,n} \end{bmatrix}$$

i.e. $f(:,)$ stacks the columns of the matrix f .

7.1.1 A Basic Portfolio Optimization Model

The classical Markowitz portfolio optimization problem considers investing in n stocks or assets held over a period of time. Let x_j denote the amount invested in asset j , and assume a stochastic model where the return of the assets is a random variable r with known mean

$$\mu = \mathbf{E}r$$

and covariance

$$\Sigma = \mathbf{E}(r - \mu)(r - \mu)^T.$$

The return of the investment is also a random variable $y = r^T x$ with mean (or expected return)

$$\mathbf{E}y = \mu^T x$$

and variance (or risk)

$$(y - \mathbf{E}y)^2 = x^T \Sigma x.$$

The problem facing the investor is to rebalance the portfolio to achieve a good compromise between risk and expected return, e.g., maximize the expected return subject to a budget constraint and an upper bound (denoted γ) on the tolerable risk. This leads to the optimization problem

$$\begin{aligned} & \text{maximize} && \mu^T x \\ & \text{subject to} && e^T x = w + e^T x^0, \\ & && x^T \Sigma x \leq \gamma^2, \\ & && x \geq 0. \end{aligned} \tag{7.1}$$

The variables x denote the investment i.e. x_j is the amount invested in asset j and x_j^0 is the initial holding of asset j . Finally, w is the initial amount of cash available.

A popular choice is $x^0 = 0$ and $w = 1$ because then x_j may be interpreted as the relative amount of the total portfolio that is invested in asset j .

Since e is the vector of all ones then

$$e^T x = \sum_{j=1}^n x_j$$

is the total investment. Clearly, the total amount invested must be equal to the initial wealth, which is

$$w + e^T x^0.$$

This leads to the first constraint

$$e^T x = w + e^T x^0.$$

The second constraint

$$x^T \Sigma x \leq \gamma^2$$

ensures that the variance, or the risk, is bounded by γ^2 . Therefore, γ specifies an upper bound of the standard deviation the investor is willing to undertake. Finally, the constraint

$$x_j \geq 0$$

excludes the possibility of short-selling. This constraint can of course be excluded if short-selling is allowed.

The covariance matrix Σ is positive semidefinite by definition and therefore there exist a matrix G such that

$$\Sigma = GG^T. \tag{7.2}$$

In general the choice of G is **not** unique and one possible choice of G is the Cholesky factorization of Σ . However, in many cases another choice is better for efficiency reasons as discussed in Section 7.1.3.

For a given G we have that

$$\begin{aligned} x^T \Sigma x &= x^T GG^T x \\ &= \|G^T x\|^2. \end{aligned}$$

Hence, we may write the risk constraint as

$$\gamma \geq \|G^T x\|$$

or equivalently

$$[\gamma; G^T x] \in \mathcal{Q}^{n+1}.$$

where \mathcal{Q}^{n+1} is the $n + 1$ dimensional quadratic cone. Therefore, problem (7.1) can be written as

$$\begin{aligned} & \text{maximize} && \mu^T x \\ & \text{subject to} && e^T x = w + e^T x^0, \\ & && [\gamma; G^T x] \in \mathcal{Q}^{n+1}, \\ & && x \geq 0, \end{aligned} \tag{7.3}$$

which is a conic quadratic optimization problem that can easily be solved using **MOSEK**.

Subsequently we will use the example data

$$\mu = \begin{bmatrix} 0.1073 \\ 0.0737 \\ 0.0627 \end{bmatrix}$$

and

$$\Sigma = 0.1 \begin{bmatrix} 0.2778 & 0.0387 & 0.0021 \\ 0.0387 & 0.1112 & -0.0020 \\ 0.0021 & -0.0020 & 0.0115 \end{bmatrix}$$

This implies

$$G^T = \sqrt{0.1} \begin{bmatrix} 0.5271 & 0.0734 & 0.0040 \\ 0 & 0.3253 & -0.0070 \\ 0 & 0 & 0.1069 \end{bmatrix}$$

using 5 figures of accuracy. Moreover, let

$$x^0 = \begin{bmatrix} 0.0 \\ 0.0 \\ 0.0 \end{bmatrix}$$

and

$$w = 1.0.$$

The data has been taken from [CT07].

Why a Conic Formulation?

Problem (7.1) is a convex quadratically constrained optimization problems that can be solved directly using **MOSEK**, then why reformulate it as a conic quadratic optimization problem? The main reason for choosing a conic model is that it is more robust and usually leads to a shorter solution times. For instance it is not always easy to determine whether the Q matrix in (7.1) is positive semidefinite due to the presence of rounding errors. It is also very easy to make a mistake so Q becomes indefinite. These causes of problems are completely eliminated in the conic formulation.

Moreover, observe the constraint

$$\|G^T x\| \leq \gamma$$

is nicer than

$$x^T \Sigma x \leq \gamma^2$$

for small and values of γ . For instance assume a γ of 10000 then γ^2 would 1.0e8 which introduces a scaling issue in the model. Hence, using conic formulation it is possible to work with the standard deviation instead of the variance, which usually gives rise to a better scaled model.

Implementing the Portfolio Model

Model (7.3) can not be implemented as stated using the **MOSEK** optimizer API because the API requires the problem to be on the form

$$\begin{aligned} & \text{maximize} && c^T \hat{x} \\ & \text{subject to} && l^c \leq A\hat{x} \leq u^c, \\ & && l^x \leq \hat{x} \leq u^x, \\ & && \hat{x} \in \mathcal{K}. \end{aligned} \quad (7.4)$$

where \hat{x} is referred to as the API variable.

The first step in bringing (7.3) to the form (7.4) is the reformulation

$$\begin{aligned} & \text{maximize} && \mu^T x \\ & \text{subject to} && e^T x = w + e^T x^0, \\ & && G^T x - t = 0 \\ & && [s; t] \in \mathcal{Q}^{n+1}, \\ & && x \geq 0, \\ & && s \geq 0. \end{aligned} \quad (7.5)$$

where s is an additional scalar variable and t is a n dimensional vector variable. The next step is to define a mapping of the variables

$$\hat{x} = [x; s; t] = \begin{bmatrix} x \\ s \\ t \end{bmatrix}. \quad (7.6)$$

Hence, the API variable \hat{x} is concatenation of model variables x , s and t . In Table 7.1 the details of the concatenation are specified.

Table 7.1: Storage layout of the \hat{x} variable.

Variable	Length	Offset
x	n	1
s	1	$n+1$
t	n	$n+2$

For instance it can be seen that

$$\hat{x}_{n+2} = t_1.$$

because the offset of the t variable is $n + 2$.

Given the ordering of the variables specified by (7.6) the data should be defined as follows

$$\begin{aligned} c &= \begin{bmatrix} \mu^T & 0 & 0_{n,1} \end{bmatrix}^T, \\ A &= \begin{bmatrix} e^T & 0 & 0_{n,1} \\ G^T & 0_{n,1} & -I_n \end{bmatrix}^T, \\ l^c &= \begin{bmatrix} w + e^T x^0 & 0_{1,n} \end{bmatrix}^T, \\ u^c &= \begin{bmatrix} w + e^T x^0 & 0_{1,n} \end{bmatrix}^T, \\ l^x &= \begin{bmatrix} 0_{1,n} & \gamma & -\infty_{n,1} \end{bmatrix}^T, \\ u^x &= \begin{bmatrix} \infty_{n,1} & \gamma & \infty_{n,1} \end{bmatrix}^T. \end{aligned}$$

The next step is to consider how the columns of A is defined. The following pseudo code

$$\begin{aligned}
 & \text{for } j = 1 : n \\
 & \quad \hat{x}_j = x_j \\
 & \quad A_{1,j} = 1.0 \\
 & \quad A_{2:(n+1),j} = G_{j,1:n}^T \\
 & \hat{x}_{n+1} = s \\
 & \text{for } j = 1 : n \\
 & \quad \hat{x}_{n+1+j} = t_j \\
 & \quad A_{n+1+j,n+1+j} = -1.0
 \end{aligned}$$

show how to construct each column of A .

In the above discussion index origin 1 is employed, i.e., the first position in a vector is 1. The C programming language employs 0 as index origin and that should be kept in mind when reading the example code.

```

#include <math.h>

```

The above code produce the result

Listing 7.1: Output from the solver.

```

Interior-point solution summary
Problem status  : PRIMAL_AND_DUAL_FEASIBLE
Solution status : OPTIMAL

```

```
Primal.  obj: 7.4766497707e-002  Viol.  con: 2e-008  var: 0e+000  cones: 3e-009
Dual.    obj: 7.4766522618e-002  Viol.  con: 0e+000  var: 4e-008  cones: 0e+000

Expected return 7.476650e-002 for gamma 5.000000e-002
```

The source code should be self-explanatory but a few comments are nevertheless in place.

The code use a macro called MOSEKCALL which is defined as follows

```
#define MOSEKCALL(_r,_call)  ( (_r)==MSK_RES_OK ? ( (_r) = (_call) ) : ( (_r) = (_r) ) );
```

so for instance

```
MOSEKCALL(res,MSK_optimize());
```

is the same as

```
if ( res==MSK_RES_OK )
    res = MSK_optimize()
```

so the usage of MOSEKCALL is method for hiding if statements and hence making the code more compact.

In the lines

```
offsetx = 0;  /* Offset of variable x into the API variable. */
offsets = n;  /* Offset of variable x into the API variable. */
offsett = n+1; /* Offset of variable t into the API variable. */
```

offsets into the **MOSEK** API variables are stored and those offsets are used later. The code

```
for(j=0; j<n; ++j)
{
    MOSEKCALL(res,MSK_putcj(task,offsetx+j,mu[j]));
    MOSEKCALL(res,MSK_putaij(task,0,offsetx+j,1.0));
    for(k=0; k<n; ++k)
        if( GT[k][j]!=0.0 )
            MOSEKCALL(res, MSK_putaij(task, 1 + k, offsetx + j, GT[k][j]));

    MOSEKCALL(res,MSK_putvarbound(task,offsetx+j,MSK_BK_LO,0.0,MSK_INFINITY));
    sprintf(buf, "x[%d]",1+j);
    MOSEKCALL(res,MSK_putvarname(task,offsetx+j,buf));
}
```

sets up the data for x variables. For instance

```
MOSEKCALL(res,MSK_putcj(task,offsetx+j,mu[j]));
```

inputs the objective coefficients for the x variables. Moreover, the code

```
sprintf(buf, "x[%d]",1+j);
MOSEKCALL(res,MSK_putvarname(task,offsetx+j,buf));
```

assigns meaningful names to the API variables. This is not needed but it makes debugging easier.

Debugging Tips

Implementing an optimization model in optimizer can be cumbersome and error-prone and it is very easy to make mistakes. In order to check the implemented code for mistakes it is very useful to dump the problem to a file in a human readable form for visual inspection. The line

```
MOSEKCALL(res,MSK_writedata(task,"dump.opf"));
```

does that and this will produce a file with the content

Listing 7.2: Problem (7.5) stored in OPF format.

Observe that since the API variables have been given meaningful names it is easy to see the model is correct.

7.1.2 The efficient Frontier

The portfolio computed by the Markowitz model is efficient in the sense that there is no other portfolio giving a strictly higher return for the same amount of risk. An efficient portfolio is also sometimes called a Pareto optimal portfolio. Clearly, an investor should only invest in efficient portfolios and therefore it may be relevant to present the investor with all efficient portfolios so the investor can choose the portfolio that has the desired tradeoff between return and risk.

Given a nonnegative α then the problem

$$\begin{aligned} & \text{maximize} && \mu^T x - \alpha s \\ & \text{subject to} && e^T x = w + e^T x^0, \\ & && [s; G^T x] \in \mathcal{Q}^{n+1}, \\ & && x \geq 0. \end{aligned} \tag{7.7}$$

computes efficient portfolios. Note that the objective maximizes the expected return while maximizing $-\alpha$ times the standard deviation. Hence, the standard deviation is minimized while α specifies the tradeoff between expected return and risk.

Ideally the problem (7.7) should be solved for all values $\alpha \geq 0$ but in practice that is computationally too costly.

Using the example data from Section 7.1.1, the optimal values of return and risk for several α s are listed below:

Listing 7.3: Results obtained solving problem (7.7) for different values of α .

alpha	exp ret	std dev
0.000e+000	1.073e-001	7.261e-001
2.500e-001	1.033e-001	1.499e-001
5.000e-001	6.976e-002	3.735e-002
7.500e-001	6.766e-002	3.383e-002
1.000e+000	6.679e-002	3.281e-002
1.500e+000	6.599e-002	3.214e-002
2.000e+000	6.560e-002	3.192e-002
2.500e+000	6.537e-002	3.181e-002
3.000e+000	6.522e-002	3.176e-002
3.500e+000	6.512e-002	3.173e-002
4.000e+000	6.503e-002	3.170e-002
4.500e+000	6.497e-002	3.169e-002

The example code in Listing 7.4 demonstrates how to compute the efficient portfolios for several values of α .

7.1.3 Improving the Computational Efficiency

In practice it is often important to solve the portfolio problem in a short amount of time; this section it is discusses what can be done at the modelling stage to improve the computational efficiency.

The computational cost is of course to some extent dependent on the number of constraints and variables in the optimization problem. However, in practice a more important factor is the number nonzeros used to represent the problem. Indeed it is often better to focus at the number of nonzeros in G (see (7.2)) and try to reduce that number by for instance changing the choice of G .

In other words, if the computational efficiency should be improved then it is always good idea to start with focusing at the covariance matrix. As an example assume that

$$\Sigma = D + VV^T$$

where D is positive definite diagonal matrix. Moreover, V is a matrix with n rows and p columns. Such a model for the covariance matrix is called a factor model factor model and usually p tends be a small number, say less than 100, independent of n .

One possible choice for G is the Cholesky factorization of Σ which requires storage proportional to $n(n+1)/2$. However, another choice is

$$G^T = \begin{bmatrix} D^{1/2} \\ V^T \end{bmatrix}$$

because then

$$GG^T = D + VV^T.$$

This choice requires storage proportional to $n + pn$ which is much less than for the Cholesky choice of G . Indeed assuming p is a constant then the difference in storage requirements is a factor of n .

The example above exploits the so-called factor structure and demonstrates that an alternative choice of G may lead to a significant reduction in the amount of storage used to represent the problem. This will in most cases also lead to a significant reduction in the solution time.

The lesson to be learned is that it is important to investigate how the covariance is formed. Given this knowledge it might be possible to make a special choice for G that helps reducing the storage requirements and enhance the computational efficiency.

7.1.4 Slippage Cost

The basic Markowitz portfolio model assumes that there are no costs associated with trading the assets and that the returns of the assets is independent of the amount traded. None of those assumptions are usually valid in practice. Therefore, a more realistic model is

$$\begin{aligned} & \text{maximize} && \mu^T x \\ & \text{subject to} && e^T x + \sum_{j=1}^n C_j(x_j - x_j^0) = w + e^T x^0, \\ & && x^T \Sigma x \leq \gamma^2, \\ & && x \geq 0, \end{aligned} \tag{7.8}$$

where the function

$$C_j(x_j - x_j^0)$$

specifies the transaction costs when the holding of asset j is changed from its initial value.

Market Impact Costs

If the initial wealth is fairly small and short selling is not allowed, then the holdings will be small. Therefore, the amount traded of each asset must also be small. Hence, it is reasonable to assume that

the prices of the assets is independent of the amount traded. However, if a large volume of an asset is sold or purchased it can be expected that the price change and hence the expected return also change. This effect is called market impact costs. It is common to assume that market impact costs for asset j can be modelled by

$$m_j \sqrt{|x_j - x_j^0|}$$

where m_j is a constant that is estimated in some way. See [GK00][p. 452] for details. To summarize then

$$C_j(x_j - x_j^0) = m_j |x_j - x_j^0| \sqrt{|x_j - x_j^0|} = m_j |x_j - x_j^0|^{3/2}.$$

From [MOSEKApS12] it is known

$$\{(c, z) : c \geq z^{3/2}, z \geq 0\} = \{(c, z) : [v; c; z], [z; 1/8; v] \in \mathcal{Q}_r^3\}$$

where \mathcal{Q}_r^3 is the 3 dimensional rotated quadratic cone implying

$$\begin{aligned} z_j &= |x_j - x_j^0|, \\ [v_j; c_j; z_j], [z_j; 1/8; v_j] &\in \mathcal{Q}_r^3, \\ \sum_{j=1}^n C_j(x_j - x_j^0) &= \sum_{j=1}^n c_j. \end{aligned}$$

Unfortunately this set of constraints is nonconvex due to the constraint

$$z_j = |x_j - x_j^0| \tag{7.9}$$

but in many cases that constraint can safely be replaced by the relaxed constraint

$$z_j \geq |x_j - x_j^0| \tag{7.10}$$

which is convex. If for instance the universe of assets contains a risk free asset with a positive return then

$$z_j > |x_j - x_j^0| \tag{7.11}$$

cannot hold for an optimal solution because that would imply the solution is not optimal.

Now assume that the optimal solution has the property that (7.11) holds then the market impact cost within the model is larger than the true market impact cost and hence money are essentially considered garbage and removed by generating transaction costs. This may happen if a portfolio with very small risk is requested because then the only way to obtain a small risk is to get rid of some of the assets by generating transaction costs. Here it is assumed this is not the case and hence the models (7.9) and (7.10) are equivalent.

Formula (7.10) is replaced by constraints

$$\begin{aligned} z_j &\geq x_j - x_j^0, \\ z_j &\geq -(x_j - x_j^0). \end{aligned} \tag{7.12}$$

Now we have

$$\begin{aligned} &\text{maximize} && \mu^T x \\ &\text{subject to} && e^T x + m^T c = w + e^T x^0, \\ & && z_j \geq x_j - x_j^0, \quad j = 1, \dots, n, \\ & && z_j \geq x_j^0 - x_j, \quad j = 1, \dots, n, \\ & && [\gamma; G^T x] \in \mathcal{Q}_r^{n+1}, \\ & && [v_j; c_j; z_j] \in \mathcal{Q}_r^3, \quad j = 1, \dots, n, \\ & && [z_j; 1/8; v_j] \in \mathcal{Q}_r^3, \quad j = 1, \dots, n, \\ & && x \geq 0. \end{aligned} \tag{7.13}$$

The revised budget constraint

$$e^T x = w + e^T x^0 - m^T c$$

specifies that the total investment must be equal to the initial wealth minus the transaction costs. Moreover, observe the variables v and z are some auxiliary variables that model the market impact cost. Indeed it holds

$$z_j \geq |x_j - x_j^0|$$

and

$$c_j \geq z_j^{3/2}.$$

Before proceeding it should be mentioned that transaction costs of the form

$$c_j \geq z_j^{p/q}$$

where p and q are both integers and $p \geq q$ can be modelled using quadratic cones. See [\[MOSEKApS12\]](#) for details.

One more reformulation of (7.13) is needed,

$$\begin{array}{llll} \text{maximize} & \mu^T x & & \\ \text{subject to} & e^T x + m^T c & = & w + e^T x^0, \\ & G^T x - t & = & 0, \\ & z_j - x_j & \geq & -x_j^0, \quad j = 1, \dots, n, \\ & z_j + x_j & \geq & x_j^0, \quad j = 1, \dots, n, \\ & [v_j; c_j; z_j] - f_{j,1:3} & = & 0, \quad j = 1, \dots, n, \\ & [z_j; 0; v_j] - g_{j,1:3} & = & [0; -1/8; 0], \quad j = 1, \dots, n, \\ & [s; t] & \in & \mathcal{Q}^{n+1}, \\ & f_{j,1:3}^T & \in & \mathcal{Q}_r^3, \quad j = 1, \dots, n, \\ & g_{j,1:3}^T & \in & \mathcal{Q}_r^3, \quad j = 1, \dots, n, \\ & x & \geq & 0, \\ & s & = & \gamma, \end{array} \tag{7.14}$$

where $f, g \in \mathbb{R}^{n \times 3}$. These additional variables f and g are only introduced to bring the problem on the API standard form.

The formulation (7.14) is not the most compact possible. However, the **MOSEK** presolve will automatically make it more compact and since it is easier to implement (7.14) than a more compact form then the form (7.14) is preferred.

The first step in developing the optimizer API implementation is to chose an ordering of the variables. In this case the ordering

$$\hat{x} = \begin{bmatrix} x \\ s \\ t \\ c \\ v \\ z \\ f^T(\cdot) \\ g^T(\cdot) \end{bmatrix}$$

will be used. Note $f^T(\cdot)$ means the rows of f are transposed and stacked on top of each other to form a long column vector. Table 7.2 shows the mapping between the \hat{x} and the model variables.

Table 7.2: Storage layout for the \hat{x}

Variable	Length	Offset
x	n	1
s	1	$n+1$
t	n	$n+2$
c	n	$2n+2$
v	n	$3n+2$
z	n	$4n+2$
$f(\cdot)^T$	$3n$	$7n+2$
$g(\cdot)^T$	$3n$	$10n+2$

The next step is to consider how the columns of A is defined. Reusing the idea in Section 7.1.1 then the

following pseudo code describes the setup of A .

```

for       $j = 1 : n$ 
     $\hat{x}_j = x_j$ 
     $A_{1,j} = 1.0$ 
     $A_{2:n+1,j} = G_{j,1:n}^T$ 
     $A_{n+1+j,j} = -1.0$ 
     $A_{2n+1+j,j} = 1.0$ 

 $\hat{x}_{n+1} = s$ 

for       $j = 1 : n$ 
     $\hat{x}_{n+1+j} = t_j$ 
     $A_{1+j,n+1+j} = -1.0$ 

for       $j = 1 : n$ 
     $\hat{x}_{2n+1+j} = c_j$ 
     $A_{1,2n+1+j} = m_j$ 
     $A_{3n+1+3(j-1)+2,2n+1+j} = 1.0$ 

for       $j = 1 : n$ 
     $\hat{x}_{3n+1+j} = v_j$ 
     $A_{3n+1+3(j-1)+1,3n+1+j} = 1.0$ 
     $A_{6n+1+3(j-1)+3,3n+1+j} = 1.0$ 

for       $j = 1 : n$ 
     $\hat{x}_{4n+1+j} = z_j$ 
     $A_{1+n+j,4n+1+j} = 1.0$ 
     $A_{1+2n+j,4n+1+j} = 1.0$ 
     $A_{3n+1+3(j-1)+3,4n+1+j} = 1.0$ 
     $A_{6n+1+3(j-1)+1,4n+1+j} = 1.0$ 

for       $j = 1 : n$ 
     $\hat{x}_{7n+1+3(j-1)+1} = f_{j,1}$ 
     $A_{3n+1+3(j-1)+1,7n+(3(j-1)+1)} = -1.0$ 
     $\hat{x}_{7n+1+3(j-1)+2} = f_{j,2}$ 
     $A_{3n+1+3(j-1)+2,7n+(3(j-1)+2)} = -1.0$ 
     $\hat{x}_{7n+1+3(j-1)+3} = f_{j,3}$ 
     $A_{3n+1+3(j-1)+3,7n+(3(j-1)+3)} = -1.0$ 

for       $j = 1 : n$ 
     $\hat{x}_{10n+1+3(j-1)+1} = g_{j,1}$ 
     $A_{6n+1+3(j-1)+1,7n+(3(j-1)+1)} = -1.0$ 
     $\hat{x}_{10n+1+3(j-1)+2} = g_{j,2}$ 
     $A_{6n+1+3(j-1)+2,7n+(3(j-1)+2)} = -1.0$ 
     $\hat{x}_{10n+1+3(j-1)+3} = g_{j,3}$ 
     $A_{6n+1+3(j-1)+3,7n+(3(j-1)+3)} = -1.0$ 

```

The example code in [Listing 7.5](#) demonstrates how to implement the model (7.14).

Listing 7.5: Code implementing model (7.14).

```

#include <math.h>

The file verifies that the correct problem has been setup.

ERRORS AND WARNINGS

Interaction between **MOSEK** and the user is not always successful and critical situation may arise for several reasons: wrong input data, unexpected numerical issues, not enough memory, etc. **MOSEK** reports these events to the user making the following distinction:

- *Warning*: it informs the user about a non critical but important event that will not prevent the solver execution. When a warning arises the final results may not be the expected.
- *Error*: it informs the user about a critical and possibly unrecoverable event. The required operation will not be performed correctly.

Therefore errors and warnings must be handled carefully to use the solver in a safe way.

8.1 Warnings

Warning messages generated by **MOSEK** should in general never be ignored. Despite not being critical, they provide useful information and often are the key to understand how to improve the solver performance or solve numerical issues. For this reason, it is a good practice to start working with a verbose output on the screen (see Section 9) in order to spot possible warnings.

Typically warnings involve

- Numerical criticalities in the optimization model: for instance if very large upper bound on a constraint is specified, the solver will notify the user with a message like the following

```
MOSEK warning 53: A numerically large upper bound value 6.6e+09 is specified
↳for constraint 'C69200' (46020).
```

- Wrong parameter values

Ideally the solver should not rise any warning. The user should work on the optimization model and the way the solver is called in order to remove all warnings. We recommend to ignore warnings only if

- they are well understood by the user and therefore deliberately ignored;
- they are related to non critical operations (as for instance variable naming) and the results obtained are correct.

In these cases, warnings can be suppressed by setting the `MSK_IPAR_MAX_NUM_WARNINGS` parameter to zero.

8.2 Errors

Errors are the result of

- wrong input data (too large variable index for instance)
- system limitation (for instance not enough memory available)

- bugs in the API (see Section 1.2)

Most functions in the **MOSEK** Optimizer API for C return a *response code* which indicates whether an error occurred. It is recommended to check to the response code and in case it is indicating an error then an appropriate action should be taken.

8.2.1 Fatal Error Handling

If **MOSEK** encounter a fatal error caused by either an internal bug or a user error, an *exit function* is called. It is possible to tell **MOSEK** to use a custom exit function using the `env.putexitfunc` function. The user-defined exit function will then be called if a fatal error is detected. The purpose of an exit function is to print out a suitable message that can help diagnose the cause of the error.

8.2.2 Checking for Memory Leaks and Overwrites

If you suspect that **MOSEK** or your own application incorrectly overwrites memory or leaks memory, we suggest you use external tools such as [Intel Inspector](#) for C and .NET, or [Valgrind](#) to pinpoint the cause of the problem.

Alternatively, **MOSEK** has a memory check feature which can be enabled by letting the argument `dgbfile` be the name of a writable file when calling `env.makeenv`. If `dgbfile` is a valid file name, then **MOSEK** will write memory debug information to this file.

Assuming memory debugging is turned on, **MOSEK** will warn about **MOSEK** specific memory leaks when a **MOSEK** environment or task is deleted.

Moreover, the functions `env.checkmemenv` and `task.checkmemtask` can be used to check the memory allocated by a **MOSEK** environment or task at any time. If one these functions finds that the memory has been corrupted a fatal error is generated.

8.2.3 Debugging Tips

Turn on logging

While developing a new application it is recommended to turn on logging, so that error and diagnostics messages are displayed.

Using the `task.linkfiletotaskstream` function a file can be linked to a task stream. This means that all messages sent to a task stream are also written to a file. As an example consider the code fragment:

```
MSK_linkfiletotaskstream(task, MSK_STREAM_LOG, "moseklog.txt");
```

which shows how to link the file `moseklog.txt` to the log stream.

It is also possible to link a custom function to a stream using the `task.linkfunctotaskstream` function. Please refer to Section 9 for further information.

Dump problem to OPF file

If something is wrong with a problem or a solution, one option is to output the problem to an *OPF file* and inspect it by hand. Use the `task.writedata` function to write a task to a file immediately before optimizing, for example as follows:

```
MSK_writedata(task, "taskdump.opf");  
MSK_optimize(task);
```

This will write the problem in `task` to the file `taskdump.opf`. Inspecting the text file `taskdump.opf` may reveal what is wrong in the problem setup.

MANAGING I/O

The main purpose of this chapter is to give an overview on the logging and I/O features provided by the **MOSEK** package.

- Section 9.1 contains information about the log streams provided by **MOSEK**.
- File I/O is discussed in Section 9.2.
- How to tune the logging verbosity is the topic of Section 9.3.

9.1 Stream I/O

MOSEK execution produces a certain amount of logging at environment and task level. This means that the logging from each environment and task can be isolated from the others.

The log messages are partitioned in three streams:

- **messages**
- **warnings**
- **errors**

These streams are aggregated in the **log** stream. See *MSKstreamtypee*.

Each stream can be redirected either to a user defined function or to a file.

MOSEK also provide functions to allow user to write output to a desired stream in order to keep such output separation. For instance, a user can use the *task.echotask* function to write its one message onto the **message** stream:

```
MSK_echotask(task, MSK_STREAM_MSG, "The user is John");
```

Log stream to function

Link a custom function to a stream is particularly useful to generate specialize output.

Using the *task.linkfunctotaskstream* function, the user can provide a pointer to the function to be called when the solver generate output for a specific stream on a specific task/environment.

Log stream to file

A stream can be redirected to a file passing to the solver the file name. The solver creates the file anew or append the log to an existing one. The file is closed when the task/environment is destroyed.

Using the *task.linkfiletotaskstream* function a file can be linked to a task stream. This means that all messages sent to a task stream are also written to a file. As an example consider

```
MSK_linkfiletotaskstream(task, MSK_STREAM_LOG , "moseklog.txt");
```

which shows how to link the file `moseklog.txt` to the log stream. In a similar way, an environment stream can be directed to a file using the `env.linkfiletoenvstream` function.

9.2 File I/O

MOSEK supports a range of problem and solution formats listed in Section 17. One such format is **MOSEK**'s native binary *Task format* which supports all features that **MOSEK** supports.

The file format used in I/O operations is deduced from extension - as in `problemname.task` - unless the parameter `MSK_IPAR_WRITE_DATA_FORMAT` is specified to something else. Problem files with an additional `.gz` extension - as in `problemname.task.gz` - are moreover assumed to use GZIP compression, and are automatically compressed, respectively decompressed, when written or read.

Example

If something is wrong with a problem or a solution, one option is to output the problem to the human-readable *OPF format* and inspect it by hand. For instance, one may use the `task.writedata` function to write the problem to a file immediately before optimizing it:

```
MSK_writedata(task, "data.opf");  
MSK_optimize(task);
```

This will write the problem in `task` to the file `data.opf`.

9.3 Verbosity

The logging verbosity can be controlled by setting the relevant parameters, as for instance

- `MSK_IPAR_LOG`,
- `MSK_IPAR_LOG_INTPNT`,
- `MSK_IPAR_LOG_MIO`,
- `MSK_IPAR_LOG_CUT_SECOND_OPT`,
- `MSK_IPAR_LOG_SIM`, and
- `MSK_IPAR_LOG_SIM_MINOR`.

Each parameter control the output level of a specific functionality or algorithm. The main switch is `MSK_IPAR_LOG` which affect the whole output. The actual log level for a specific functionality is determined as the minimum between `MSK_IPAR_LOG` and the relevant parameter. For instance, the log level for the output produce by the interior-point algorithm is tuned by the `MSK_IPAR_LOG_INTPNT`: the actual log level is defined by the minimum between `MSK_IPAR_LOG` and `MSK_IPAR_LOG_INTPNT`.

Tuning the solver verbosity may require adjusting several parameters. It must be noticed that verbose logging is supposed to be of interest during debugging and tuning, and it is consider the default setting. When output is no more of interest, user can easily disable using `MSK_IPAR_LOG`.

Moreover, it must be understood that larger values of `MSK_IPAR_LOG` do not necessarily result in an increased output.

By default **MOSEK** will reduce the amount of log information after the first optimization on a given task. To get full log output on subsequent optimizations set `MSK_IPAR_LOG_CUT_SECOND_OPT` to zero.

PROBLEM FORMULATION AND SOLUTIONS

In this chapter we will discuss the following issues:

- The formal definitions of the problem types that **MOSEK** can solve.
- The solution information produced by **MOSEK**.
- The information produced by **MOSEK** if the problem is infeasible.

10.1 Linear Optimization

A linear optimization problem can be written as

$$\begin{array}{ll} \text{minimize} & c^T x + c^f \\ \text{subject to} & \begin{array}{ll} l^c \leq & Ax \leq u^c, \\ l^x \leq & x \leq u^x, \end{array} \end{array} \quad (10.1)$$

where

- m is the number of constraints.
- n is the number of decision variables.
- $x \in \mathbb{R}^n$ is a vector of decision variables.
- $c \in \mathbb{R}^n$ is the linear part of the objective function.
- $A \in \mathbb{R}^{m \times n}$ is the constraint matrix.
- $l^c \in \mathbb{R}^m$ is the lower limit on the activity for the constraints.
- $u^c \in \mathbb{R}^m$ is the upper limit on the activity for the constraints.
- $l^x \in \mathbb{R}^n$ is the lower limit on the activity for the variables.
- $u^x \in \mathbb{R}^n$ is the upper limit on the activity for the variables.

A primal solution (x) is *(primal) feasible* if it satisfies all constraints in (10.1). If (10.1) has at least one primal feasible solution, then (10.1) is said to be (primal) feasible.

In case (10.1) does not have a feasible solution, the problem is said to be *(primal) infeasible*.

10.1.1 Duality for Linear Optimization

Corresponding to the primal problem (10.1), there is a dual problem

$$\begin{array}{ll} \text{maximize} & (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ & A^T y + s_l^x - s_u^x = c, \\ \text{subject to} & -y + s_l^c - s_u^c = 0, \\ & s_l^c, s_u^c, s_l^x, s_u^x \geq 0. \end{array} \quad (10.2)$$

If a bound in the primal problem is plus or minus infinity, the corresponding dual variable is fixed at 0, and we use the convention that the product of the bound value and the corresponding dual variable is 0. E.g.

$$l_j^x = -\infty \quad \Rightarrow \quad (s_l^x)_j = 0 \text{ and } l_j^x \cdot (s_l^x)_j = 0.$$

This is equivalent to removing variable $(s_l^x)_j$ from the dual problem. A solution

$$(y, s_l^c, s_u^c, s_l^x, s_u^x)$$

to the dual problem is feasible if it satisfies all the constraints in (10.2). If (10.2) has at least one feasible solution, then (10.2) is *(dual) feasible*, otherwise the problem is *(dual) infeasible*.

A Primal-dual Feasible Solution

A solution

$$(x, y, s_l^c, s_u^c, s_l^x, s_u^x)$$

is denoted a *primal-dual feasible solution*, if (x) is a solution to the primal problem (10.1) and $(y, s_l^c, s_u^c, s_l^x, s_u^x)$ is a solution to the corresponding dual problem (10.2).

The Duality Gap

Let

$$(x^*, y^*, (s_l^c)^*, (s_u^c)^*, (s_l^x)^*, (s_u^x)^*)$$

be a primal-dual feasible solution, and let

$$(x^c)^* := Ax^*.$$

For a primal-dual feasible solution we define the *duality gap* as the difference between the primal and the dual objective value,

$$\begin{aligned} c^T x^* + c^f - \{ & (l^c)^T (s_l^c)^* - (u^c)^T (s_u^c)^* + (l^x)^T (s_l^x)^* - (u^x)^T (s_u^x)^* + c^f \} \\ &= \sum_{i=0}^{m-1} [(s_l^c)^* ((x_i^c)^* - l_i^c) + (s_u^c)^* (u_i^c - (x_i^c)^*)] \\ &+ \sum_{j=0}^{n-1} [(s_l^x)^* (x_j - l_j^x) + (s_u^x)^* (u_j^x - x_j^*)] \geq 0 \end{aligned} \quad (10.3)$$

where the first relation can be obtained by transposing and multiplying the dual constraints (10.2) by x^* and $(x^c)^*$ respectively, and the second relation comes from the fact that each term in each sum is nonnegative. It follows that the primal objective will always be greater than or equal to the dual objective.

An Optimal Solution

It is well-known that a linear optimization problem has an optimal solution if and only if there exist feasible primal and dual solutions so that the duality gap is zero, or, equivalently, that the *complementarity conditions*

$$\begin{aligned} (s_l^c)^* ((x_i^c)^* - l_i^c) &= 0, & i &= 0, \dots, m-1, \\ (s_u^c)^* (u_i^c - (x_i^c)^*) &= 0, & i &= 0, \dots, m-1, \\ (s_l^x)^* (x_j^* - l_j^x) &= 0, & j &= 0, \dots, n-1, \\ (s_u^x)^* (u_j^x - x_j^*) &= 0, & j &= 0, \dots, n-1, \end{aligned}$$

are satisfied.

If (10.1) has an optimal solution and **MOSEK** solves the problem successfully, both the primal and dual solution are reported, including a status indicating the exact state of the solution.

10.1.2 Infeasibility for Linear Optimization

Primal Infeasible Problems

If the problem (10.1) is infeasible (has no feasible solution), **MOSEK** will report a certificate of primal infeasibility: The dual solution reported is the certificate of infeasibility, and the primal solution is undefined.

A certificate of primal infeasibility is a feasible solution to the modified dual problem

$$\begin{aligned} & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x \\ & \text{subject to} && \\ & && A^T y + s_l^x - s_u^x = 0, \\ & && -y + s_l^c - s_u^c = 0, \\ & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0, \end{aligned} \tag{10.4}$$

such that the objective value is strictly positive, i.e. a solution

$$(y^*, (s_l^c)^*, (s_u^c)^*, (s_l^x)^*, (s_u^x)^*)$$

to (10.4) so that

$$(l^c)^T (s_l^c)^* - (u^c)^T (s_u^c)^* + (l^x)^T (s_l^x)^* - (u^x)^T (s_u^x)^* > 0.$$

Such a solution implies that (10.4) is unbounded, and that its dual is infeasible. As the constraints to the dual of (10.4) are identical to the constraints of problem (10.1), we thus have that problem (10.1) is also infeasible.

Dual Infeasible Problems

If the problem (10.2) is infeasible (has no feasible solution), **MOSEK** will report a certificate of dual infeasibility: The primal solution reported is the certificate of infeasibility, and the dual solution is undefined.

A certificate of dual infeasibility is a feasible solution to the modified primal problem

$$\begin{aligned} & \text{minimize} && c^T x \\ & \text{subject to} && \hat{l}^c \leq Ax \leq \hat{u}^c, \\ & && \hat{l}^x \leq x \leq \hat{u}^x, \end{aligned} \tag{10.5}$$

where

$$\hat{l}_i^c = \begin{cases} 0 & \text{if } l_i^c > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_i^c := \begin{cases} 0 & \text{if } u_i^c < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

and

$$\hat{l}_j^x = \begin{cases} 0 & \text{if } l_j^x > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_j^x := \begin{cases} 0 & \text{if } u_j^x < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

such that

$$c^T x < 0.$$

Such a solution implies that (10.5) is unbounded, and that its dual is infeasible. As the constraints to the dual of (10.5) are identical to the constraints of problem (10.2), we thus have that problem (10.2) is also infeasible.

Primal and Dual Infeasible Case

In case that both the primal problem (10.1) and the dual problem (10.2) are infeasible, **MOSEK** will report only one of the two possible certificates — which one is not defined (**MOSEK** returns the first certificate found).

Minimalization vs. Maximalization

When the objective sense of problem (10.1) is maximization, i.e.

$$\begin{array}{llll} \text{maximize} & & c^T x + c^f & \\ \text{subject to} & l^c \leq & Ax & \leq u^c, \\ & l^x \leq & x & \leq u^x, \end{array}$$

the objective sense of the dual problem changes to minimization, and the domain of all dual variables changes sign in comparison to (10.2). The dual problem thus takes the form

$$\begin{array}{ll} \text{minimize} & (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ \text{subject to} & \\ & A^T y + s_l^x - s_u^x = c, \\ & -y + s_l^c - s_u^c = 0, \\ & s_l^c, s_u^c, s_l^x, s_u^x \leq 0. \end{array}$$

This means that the duality gap, defined in (10.3) as the primal minus the dual objective value, becomes nonpositive. It follows that the dual objective will always be greater than or equal to the primal objective. The primal infeasibility certificate will be reported by **MOSEK** as a solution to the system

$$\begin{array}{l} A^T y + s_l^x - s_u^x = 0, \\ -y + s_l^c - s_u^c = 0, \\ s_l^c, s_u^c, s_l^x, s_u^x \leq 0, \end{array} \quad (10.6)$$

such that the objective value is strictly negative

$$(l^c)^T (s_l^c)^* - (u^c)^T (s_u^c)^* + (l^x)^T (s_l^x)^* - (u^x)^T (s_u^x)^* < 0.$$

Similarly, the certificate of dual infeasibility is an x satisfying the requirements of (10.5) such that $c^T x > 0$.

10.2 Conic Quadratic Optimization

Conic quadratic optimization is an extension of linear optimization (see Section 10.1) allowing conic domains to be specified for subsets of the problem variables. A conic quadratic optimization problem can be written as

$$\begin{array}{llll} \text{minimize} & & c^T x + c^f & \\ \text{subject to} & l^c \leq & Ax & \leq u^c, \\ & l^x \leq & x & \leq u^x, \\ & & x \in \mathcal{K}, & \end{array} \quad (10.7)$$

where set \mathcal{K} is a Cartesian product of convex cones, namely $\mathcal{K} = \mathcal{K}_1 \times \cdots \times \mathcal{K}_p$. Having the domain restriction, $x \in \mathcal{K}$, is thus equivalent to

$$x^t \in \mathcal{K}_t \subseteq \mathbb{R}^{n_t},$$

where $x = (x^1, \dots, x^p)$ is a partition of the problem variables. Please note that the n -dimensional Euclidean space \mathbb{R}^n is a cone itself, so simple linear variables are still allowed.

MOSEK supports only a limited number of cones, specifically:

- The \mathbb{R}^n set.
- The quadratic cone:

$$\mathcal{Q}^n = \left\{ x \in \mathbb{R}^n : x_1 \geq \sqrt{\sum_{j=2}^n x_j^2} \right\}.$$

- The rotated quadratic cone:

$$\mathcal{Q}_r^n = \left\{ x \in \mathbb{R}^n : 2x_1x_2 \geq \sum_{j=3}^n x_j^2, \quad x_1 \geq 0, \quad x_2 \geq 0 \right\}.$$

Although these cones may seem to provide only limited expressive power they can be used to model a wide range of problems as demonstrated in [\[MOSEKApS12\]](#).

10.2.1 Duality for Conic Quadratic Optimization

The dual problem corresponding to the conic quadratic optimization problem (10.7) is given by

$$\begin{aligned} & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ & \text{subject to} && \\ & && A^T y + s_l^x - s_u^x + s_n^x = c \\ & && -y + s_l^c - s_u^c = 0, \\ & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0, \\ & && s_n^x \in \mathcal{K}^*, \end{aligned} \tag{10.8}$$

where the dual cone \mathcal{K}^* is a Cartesian product of the cones

$$\mathcal{K}^* = \mathcal{K}_1^* \times \cdots \times \mathcal{K}_p^*,$$

where each \mathcal{K}_t^* is the dual cone of \mathcal{K}_t . For the cone types **MOSEK** can handle, the relation between the primal and dual cone is given as follows:

- The \mathbb{R}^n set:

$$\mathcal{K}_t = \mathbb{R}^{n_t} \quad \Leftrightarrow \quad \mathcal{K}_t^* = \{s \in \mathbb{R}^{n_t} : s = 0\}.$$

- The quadratic cone:

$$\mathcal{K}_t = \mathcal{Q}^{n_t} \quad \Leftrightarrow \quad \mathcal{K}_t^* = \mathcal{Q}^{n_t} = \left\{ s \in \mathbb{R}^{n_t} : s_1 \geq \sqrt{\sum_{j=2}^{n_t} s_j^2} \right\}.$$

- The rotated quadratic cone:

$$\mathcal{K}_t = \mathcal{Q}_r^{n_t} \quad \Leftrightarrow \quad \mathcal{K}_t^* = \mathcal{Q}_r^{n_t} = \left\{ s \in \mathbb{R}^{n_t} : 2s_1s_2 \geq \sum_{j=3}^{n_t} s_j^2, \quad s_1 \geq 0, \quad s_2 \geq 0 \right\}.$$

Please note that the dual problem of the dual problem is identical to the original primal problem.

10.2.2 Infeasibility for Conic Quadratic Optimization

In case **MOSEK** finds a problem to be infeasible it reports a certificate of infeasibility. This works exactly as for linear problems (see Section 10.1.2).

Primal Infeasible Problems

If the problem (10.7) is infeasible, **MOSEK** will report a certificate of primal infeasibility: The dual solution reported is the certificate of infeasibility, and the primal solution is undefined.

A certificate of primal infeasibility is a feasible solution to the problem

$$\begin{aligned} & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x \\ & \text{subject to} && \\ & && A^T y + s_l^x - s_u^x + s_n^x = 0, \\ & && -y + s_l^c - s_u^c = 0, \\ & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0, \\ & && s_n^x \in \mathcal{K}^*, \end{aligned}$$

such that the objective value is strictly positive.

Dual infeasible problems

If the problem (10.8) is infeasible, **MOSEK** will report a certificate of dual infeasibility: The primal solution reported is the certificate of infeasibility, and the dual solution is undefined.

A certificate of dual infeasibility is a feasible solution to the problem

$$\begin{aligned} & \text{minimize} && c^T x \\ & \text{subject to} && \hat{l}^c \leq Ax \leq \hat{u}^c, \\ & && \hat{l}^x \leq x \leq \hat{u}^x, \\ & && x \in \mathcal{K}, \end{aligned}$$

where

$$\hat{l}_i^c = \begin{cases} 0 & \text{if } l_i^c > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_i^c := \begin{cases} 0 & \text{if } u_i^c < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

and

$$\hat{l}_j^x = \begin{cases} 0 & \text{if } l_j^x > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_j^x := \begin{cases} 0 & \text{if } u_j^x < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

such that the objective value is strictly negative.

10.3 Semidefinite Optimization

Semidefinite optimization is an extension of conic quadratic optimization (see Section 10.2) allowing positive semidefinite matrix variables to be used in addition to the usual scalar variables. A semidefinite optimization problem can be written as

$$\begin{aligned} & \text{minimize} && \sum_{j=0}^{n-1} c_j x_j + \sum_{j=0}^{p-1} \langle \bar{C}_j, \bar{X}_j \rangle + c^f \\ & \text{subject to} && \begin{aligned} l_i^c &\leq && \sum_{j=0}^{n-1} a_{ij} x_j + \sum_{j=0}^{p-1} \langle \bar{A}_{ij}, \bar{X}_j \rangle &\leq u_i^c, & i = 0, \dots, m-1 \\ l_j^x &\leq && x_j &\leq u_j^x, & j = 0, \dots, n-1 \\ &&& x \in \mathcal{K}, \bar{X}_j \in \mathcal{S}_+^{r_j}, && j = 0, \dots, p-1 \end{aligned} \end{aligned} \quad (10.9)$$

where the problem has p symmetric positive semidefinite variables $\bar{X}_j \in \mathcal{S}_+^{r_j}$ of dimension r_j with symmetric coefficient matrices $\bar{C}_j \in \mathcal{S}^{r_j}$ and $\bar{A}_{ij} \in \mathcal{S}^{r_j}$. We use standard notation for the matrix inner product, i.e., for $U, V \in \mathbb{R}^{m \times n}$ we have

$$\langle U, V \rangle := \sum_{i=0}^{m-1} \sum_{j=0}^{n-1} U_{ij} V_{ij}.$$

With semidefinite optimization we can model a wide range of problems as demonstrated in [MOSEKApS12].

10.3.1 Duality for Semidefinite Optimization

The dual problem corresponding to the semidefinite optimization problem (10.9) is given by

$$\begin{aligned} & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ & \text{subject to} && \begin{aligned} c - A^T y + s_u^x - s_l^x &= s_n^x, \\ \bar{C}_j - \sum_{i=0}^m y_i \bar{A}_{ij} &= \bar{S}_j, & j = 0, \dots, p-1 \\ s_l^c - s_u^c &= y, \\ s_l^c, s_u^c, s_l^x, s_u^x &\geq 0, \\ s_n^x \in \mathcal{K}^*, \quad \bar{S}_j &\in \mathcal{S}_+^{r_j}, & j = 0, \dots, p-1 \end{aligned} \end{aligned} \quad (10.10)$$

where $A \in \mathbb{R}^{m \times n}$, $A_{ij} = a_{ij}$, which is similar to the dual problem for conic quadratic optimization (see Section 10.2.1), except for the addition of dual constraints

$$\left(\overline{C}_j - \sum_{i=0}^m y_i \overline{A}_{ij} \right) \in \mathcal{S}_+^{r_j}.$$

Note that the dual of the dual problem is identical to the original primal problem.

10.3.2 Infeasibility for Semidefinite Optimization

In case **MOSEK** finds a problem to be infeasible it reports a certificate of the infeasibility. This works exactly as for linear problems (see Section 10.1.2).

Primal Infeasible Problems

If the problem (10.9) is infeasible, **MOSEK** will report a certificate of primal infeasibility: The dual solution reported is a certificate of infeasibility, and the primal solution is undefined.

A certificate of primal infeasibility is a feasible solution to the problem

$$\begin{aligned} & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x \\ & \text{subject to} && A^T y + s_l^x - s_u^x + s_n^x = 0, \\ & && \sum_{i=0}^{m-1} y_i \overline{A}_{ij} + \overline{S}_j = 0, && j = 0, \dots, p-1 \\ & && -y + s_l^c - s_u^c = 0, \\ & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0, \\ & && s_n^x \in \mathcal{K}^*, \quad \overline{S}_j \in \mathcal{S}_+^{r_j}, && j = 0, \dots, p-1 \end{aligned}$$

such that the objective value is strictly positive.

Dual Infeasible Problems

If the problem (10.10) is infeasible, **MOSEK** will report a certificate of dual infeasibility: The primal solution reported is the certificate of infeasibility, and the dual solution is undefined.

A certificate of dual infeasibility is a feasible solution to the problem

$$\begin{aligned} & \text{minimize} && \sum_{j=0}^{n-1} c_j x_j + \sum_{j=0}^{p-1} \langle \overline{C}_j, \overline{X}_j \rangle \\ & \text{subject to} && \hat{l}_i^c \leq \sum_{j=1}^n a_{ij} x_j + \sum_{j=0}^{p-1} \langle \overline{A}_{ij}, \overline{X}_j \rangle \leq \hat{u}_i^c, \quad i = 0, \dots, m-1 \\ & && \hat{l}^x \leq \begin{matrix} x \\ \overline{X}_j \end{matrix} \leq \hat{u}^x, \\ & && x \in \mathcal{K}, \quad \overline{X}_j \in \mathcal{S}_+^{r_j}, && j = 0, \dots, p-1 \end{aligned}$$

where

$$\hat{l}_i^c = \begin{cases} 0 & \text{if } l_i^c > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_i^c := \begin{cases} 0 & \text{if } u_i^c < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

and

$$\hat{l}_j^x = \begin{cases} 0 & \text{if } l_j^x > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_j^x := \begin{cases} 0 & \text{if } u_j^x < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

such that the objective value is strictly negative.

10.4 Quadratic and Quadratically Constrained Optimization

A convex quadratic and quadratically constrained optimization problem is an optimization problem of the form

$$\begin{aligned} & \text{minimize} && \frac{1}{2}x^T Q^o x + c^T x + c^f \\ & \text{subject to} && \begin{aligned} l_k^c &\leq \frac{1}{2}x^T Q^k x + \sum_{j=0}^{n-1} a_{kj} x_j &\leq u_k^c, & k = 0, \dots, m-1, \\ l_j^x &\leq x_j &\leq u_j^x, & j = 0, \dots, n-1, \end{aligned} \end{aligned} \quad (10.11)$$

where Q^o and all Q^k are symmetric matrices. Moreover for convexity, Q^o must be a positive semidefinite matrix and Q^k must satisfy

$$\begin{aligned} -\infty < l_k^c &\Rightarrow Q^k \text{ is negative semidefinite,} \\ u_k^c < \infty &\Rightarrow Q^k \text{ is positive semidefinite,} \\ -\infty < l_k^c \leq u_k^c < \infty &\Rightarrow Q^k = 0. \end{aligned}$$

The convexity requirement is very important and **MOSEK** checks whether it is fulfilled.

10.4.1 A Recommendation

Any convex quadratic optimization problem can be reformulated as a conic quadratic optimization problem, see [MOSEKApS12] and in particular [And13]. In fact **MOSEK** does such conversion internally as a part of the solution process for the following reasons:

- the conic optimizer is numerically more robust than the one for quadratic problems.
- the conic optimizer is usually faster because quadratic cones are simpler than quadratic functions, even though the conic reformulation usually has more constraints and variables than the original quadratic formulation.
- it is easy to dualize the conic formulation if deemed worthwhile potentially leading to (huge) computational savings.

However, instead of relying on the automatic reformulation we recommend to formulate the problem as conic problem from scratch because:

- it saves the computational overhead of the reformulation including the convexity check. A conic problem is convex by construction and hence no convexity check is needed for conic problems.
- usually the modeller can do a better reformulation than the automatic method because the modeller can exploit the knowledge of what is being modelled.

To summarize we recommend to formulate quadratic problems and in particular quadratically constrained problems directly in conic form.

10.4.2 Duality for Quadratic and Quadratically Constrained Optimization

The dual problem corresponding to the quadratic and quadratically constrained optimization problem (10.11) is given by

$$\begin{aligned} & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x + \frac{1}{2}x^T \left\{ \sum_{k=0}^{m-1} y_k Q^k - Q^o \right\} x + c^f \\ & \text{subject to} && \begin{aligned} A^T y + s_l^x - s_u^x + \left\{ \sum_{k=0}^{m-1} y_k Q^k - Q^o \right\} x &= c, \\ -y + s_l^c - s_u^c &= 0, \\ s_l^c, s_u^c, s_l^x, s_u^x &\geq 0. \end{aligned} \end{aligned} \quad (10.12)$$

The dual problem is related to the dual problem for linear optimization (see Section 10.1.1), but depends on the variable x which in general can not be eliminated. In the solutions reported by **MOSEK**, the value of x is the same for the primal problem (10.11) and the dual problem (10.12).

10.4.3 Infeasibility for Quadratic and Quadratically Constrained Optimization

In case **MOSEK** finds a problem to be infeasible it reports a certificate of infeasibility. This works exactly as for linear problems (see Section 10.1.2).

Primal Infeasible Problems

If the problem (10.11) with all $Q^k = 0$ is infeasible, **MOSEK** will report a certificate of primal infeasibility. As the constraints are the same as for a linear problem, the certificate of infeasibility is the same as for linear optimization (see Section 10.1.2.1).

Dual Infeasible Problems

If the problem (10.12) with all $Q^k = 0$ is infeasible, **MOSEK** will report a certificate of dual infeasibility. The primal solution reported is the certificate of infeasibility, and the dual solution is undefined.

A certificate of dual infeasibility is a feasible solution to the problem

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & \hat{l}^c \leq Ax \leq \hat{u}^c, \\ & 0 \leq Q^o x \leq 0, \\ & \hat{l}^x \leq x \leq \hat{u}^x, \end{array}$$

where

$$\hat{l}_i^c = \begin{cases} 0 & \text{if } l_i^c > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_i^c := \begin{cases} 0 & \text{if } u_i^c < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

and

$$\hat{l}_j^x = \begin{cases} 0 & \text{if } l_j^x > -\infty, \\ -\infty & \text{otherwise,} \end{cases} \quad \text{and} \quad \hat{u}_j^x := \begin{cases} 0 & \text{if } u_j^x < \infty, \\ \infty & \text{otherwise,} \end{cases}$$

such that the objective value is strictly negative.

10.5 General Convex Optimization

MOSEK is capable of solving smooth (twice differentiable) convex nonlinear optimization problems of the form

$$\begin{array}{ll} \text{minimize} & f(x) + c^T x + c^f \\ \text{subject to} & l^c \leq g(x) + Ax \leq u^c, \\ & l^x \leq x \leq u^x, \end{array}$$

where

- m is the number of constraints.
- n is the number of decision variables.
- $x \in \mathbb{R}^n$ is a vector of decision variables.
- $c \in \mathbb{R}^n$ is the linear part objective function.
- $A \in \mathbb{R}^{m \times n}$ is the constraint matrix.
- $l^c \in \mathbb{R}^m$ is the lower limit on the activity for the constraints.
- $u^c \in \mathbb{R}^m$ is the upper limit on the activity for the constraints.
- $l^x \in \mathbb{R}^n$ is the lower limit on the activity for the variables.

- $u^x \in \mathbb{R}^n$ is the upper limit on the activity for the variables.
- $f : \mathbb{R}^n \rightarrow \mathbb{R}$ is a nonlinear function.
- $g : \mathbb{R}^n \rightarrow \mathbb{R}^m$ is a nonlinear vector function.

This means that the i -th constraint has the form

$$l_i^c \leq g_i(x) + \sum_{j=1}^n a_{ij}x_j \leq u_i^c.$$

The linear term Ax is included in $g(x)$ since it can be handled much more efficiently as a separate entity when optimizing.

The nonlinear functions f and g must be smooth in all $x \in [l^x; u^x]$. Moreover, $f(x)$ must be a convex function and $g_i(x)$ must satisfy

$$\begin{aligned} -\infty < l_i^c &\Rightarrow g_i(x) \text{ is concave,} \\ u_i^c < \infty &\Rightarrow g_i(x) \text{ is convex,} \\ -\infty < l_i^c \leq u_i^c < \infty &\Rightarrow g_i(x) = 0. \end{aligned}$$

10.5.1 Duality for General convex Optimization

Similar to the linear case, **MOSEK** reports dual information in the general nonlinear case. Indeed in this case the Lagrange function is defined by

$$\begin{aligned} L(x, s_l^c, s_u^c, s_l^x, s_u^x) &:= f(x) + c^T x + c^f \\ &\quad - (s_l^c)^T (g(x) + Ax - l^c) - (s_u^c)^T (u^c - g(x) - Ax) \\ &\quad - (s_l^x)^T (x - l^x) - (s_u^x)^T (u^x - x), \end{aligned}$$

and the dual problem is given by

$$\begin{aligned} &\text{maximize} && L(x, s_l^c, s_u^c, s_l^x, s_u^x) \\ &\text{subject to} && \nabla_x L(x, s_l^c, s_u^c, s_l^x, s_u^x)^T = 0, \\ &&& s_l^c, s_u^c, s_l^x, s_u^x \geq 0, \end{aligned}$$

which is equivalent to

$$\begin{aligned} &\text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ &&& + f(x) - g(x)^T y - (\nabla f(x)^T - \nabla g(x)^T y)^T x \\ &\text{subject to} && A^T y + s_l^x - s_u^x - (\nabla f(x)^T - \nabla g(x)^T y) = c, \\ &&& -y + s_l^c - s_u^c = 0, \\ &&& s_l^c, s_u^c, s_l^x, s_u^x \geq 0. \end{aligned}$$

In this context we use the following definition for scalar functions

$$\nabla f(x) = \left[\frac{\partial f(x)}{\partial x_1}, \dots, \frac{\partial f(x)}{\partial x_n} \right],$$

and accordingly for vector functions

$$\nabla g(x) = \begin{bmatrix} \nabla g_1(x) \\ \vdots \\ \nabla g_m(x) \end{bmatrix}.$$

THE OPTIMIZERS FOR CONTINUOUS PROBLEMS

The most essential part of **MOSEK** is the optimizers. Each optimizer is designed to solve a particular class of problems, i.e. linear, conic, or general nonlinear problems. The purpose of the present chapter is to discuss which optimizers are available for the continuous problem classes and how the performance of an optimizer can be tuned, if needed. This chapter deals with the optimizers for *continuous problems* with no integer variables.

When the optimizer is called, it roughly performs the following steps:

1. *Presolve*: Preprocessing to reduce the size of the problem.
2. *Dualizer*: Choosing whether to solve the primal or the dual form of the problem.
3. *Scaling*: Scaling the problem for better numerical stability.
4. *Optimize*: Solve the problem using selected method.

The first three preprocessing steps are transparent to the user, but useful to know about for tuning purposes. In general, the purpose of the preprocessing steps is to make the actual optimization more efficient and robust.

Using multiple threads

The interior-point optimizers in **MOSEK** have been parallelized. This means that if you solve linear, quadratic, conic, or general convex optimization problem using the interior-point optimizer, you can take advantage of multiple CPU's.

By default **MOSEK** will automatically select the number of threads to be employed when solving the problem. However, the number of threads employed can be changed by setting the parameter `MSK_IPAR_NUM_THREADS`. This should never exceed the number of cores on the computer.

The speed-up obtained when using multiple threads is highly problem and hardware dependent, and consequently, it is advisable to compare single threaded and multi threaded performance for the given problem type to determine the optimal settings.

For small problems, using multiple threads is not be worthwhile and may even be counter productive.

11.1 Presolve

Before an optimizer actually performs the optimization the problem is preprocessed using the so-called presolve. The purpose of the presolve is to

1. remove redundant constraints,
2. eliminate fixed variables,
3. remove linear dependencies,
4. substitute out (implied) free variables, and

5. reduce the size of the optimization problem in general.

After the presolved problem has been optimized the solution is automatically postsolved so that the returned solution is valid for the original problem. Hence, the presolve is completely transparent. For further details about the presolve phase, please see [AA95] and [AGMX96].

It is possible to fine-tune the behavior of the presolve or to turn it off entirely. If presolve consumes too much time or memory compared to the reduction in problem size gained it may be disabled. This is done by setting the parameter `MSK_IPAR_PRESOLVE_USE` to `MSK_PRESOLVE_MODE_OFF`.

The two most time-consuming steps of the presolve are

- the eliminator, and
- the linear dependency check.

Therefore, in some cases it is worthwhile to disable one or both of these.

Numerical issues in the presolve

During the presolve the problem is reformulated so that it hopefully solves faster. However, in rare cases the presolved problem may be harder to solve than the original problem. The presolve may also be infeasible although the original problem is not.

If it is suspected that presolved problem is much harder to solve than the original then it is suggested to first turn the eliminator off by setting the parameter `MSK_IPAR_PRESOLVE_ELIMINATOR_MAX_NUM_TRIES` to 0. If that does not help, then trying to turn presolve off may help.

Since all computations are done in finite precision then the presolve employs some tolerances when concluding a variable is fixed or constraint is redundant. If it happens that **MOSEK** incorrectly concludes a problem is primal or dual infeasible, then it is worthwhile to try to reduce the parameters `MSK_DPAR_PRESOLVE_TOL_X` and `MSK_DPAR_PRESOLVE_TOL_S`. However, if reducing the parameters actually helps then this should be taken as an indication that the problem is badly formulated.

Eliminator

The purpose of the eliminator is to eliminate free and implied free variables from the problem using substitution. For instance, given the constraints

$$\begin{aligned} y &= \sum_j x_j, \\ y, x &\geq 0, \end{aligned}$$

y is an implied free variable that can be substituted out of the problem, if deemed worthwhile. If the eliminator consumes too much time or memory compared to the reduction in problem size gained it may be disabled. This can be done by setting the parameter `MSK_IPAR_PRESOLVE_ELIMINATOR_MAX_NUM_TRIES` to 0. In rare cases the eliminator may cause that the problem becomes much hard to solve.

Linear dependency checker

The purpose of the linear dependency check is to remove linear dependencies among the linear equalities. For instance, the three linear equalities

$$\begin{aligned} x_1 + x_2 + x_3 &= 1, \\ x_1 + 0.5x_2 &= 0.5, \\ 0.5x_2 + x_3 &= 0.5 \end{aligned}$$

contain exactly one linear dependency. This implies that one of the constraints can be dropped without changing the set of feasible solutions. Removing linear dependencies is in general a good idea since it reduces the size of the problem. Moreover, the linear dependencies are likely to introduce numerical problems in the optimization phase.

It is best practise to build models without linear dependencies. If the linear dependencies are removed at the modeling stage, the linear dependency check can safely be disabled by setting the parameter `MSK_IPAR_PRESOLVE_LINDEP_USE` to `MSK_OFF`.

Dualizer

All linear, conic, and convex optimization problems have an equivalent dual problem associated with them. **MOSEK** has built-in heuristics to determine if it is most efficient to solve the primal or dual problem. The form (primal or dual) solved is displayed in the **MOSEK** log. Should the internal heuristics not choose the most efficient form of the problem it may be worthwhile to set the dualizer manually by setting the parameters:

- `MSK_IPAR_INTPNT_SOLVE_FORM`: In case of the interior-point optimizer.
- `MSK_IPAR_SIM_SOLVE_FORM`: In case of the simplex optimizer.

Note that currently only linear problems may be dualized.

Scaling

Problems containing data with large and/or small coefficients, say $1.0e + 9$ or $1.0e - 7$, are often hard to solve. Significant digits may be truncated in calculations with finite precision, which can result in the optimizer relying on inaccurate calculations. Since computers work in finite precision, extreme coefficients should be avoided. In general, data around the same *order of magnitude* is preferred, and we will refer to a problem, satisfying this loose property, as being *well-scaled*. If the problem is not well scaled, **MOSEK** will try to scale (multiply) constraints and variables by suitable constants. **MOSEK** solves the scaled problem to improve the numerical properties.

The scaling process is transparent, i.e. the solution to the original problem is reported. It is important to be aware that the optimizer terminates when the termination criterion is met on the scaled problem, therefore significant primal or dual infeasibilities may occur after unscaling for badly scaled problems. The best solution of this issue is to reformulate the problem, making it better scaled.

By default **MOSEK** heuristically chooses a suitable scaling. The scaling for interior-point and simplex optimizers can be controlled with the parameters `MSK_IPAR_INTPNT_SCALING` and `MSK_IPAR_SIM_SCALING` respectively.

11.2 Linear Optimization

11.2.1 Optimizer Selection

Two different types of optimizers are available for linear problems: The default is an interior-point method, and the alternatives are simplex methods. The optimizer can be selected using the parameter `MSK_IPAR_OPTIMIZER`.

11.2.2 The Interior-point Optimizer

The purpose of this section is to provide information about the algorithm employed in **MOSEK** interior-point optimizer.

In order to keep the discussion simple it is assumed that **MOSEK** solves linear optimization problems of standard form

$$\begin{aligned} &\text{minimize} && c^T x \\ &\text{subject to} && Ax = b, \\ &&& x \geq 0. \end{aligned} \tag{11.1}$$

This is in fact what happens inside **MOSEK**; for efficiency reasons **MOSEK** converts the problem to standard form before solving, then converts it back to the input form when reporting the solution.

Since it is not known beforehand whether problem (11.1) has an optimal solution, is primal infeasible or is dual infeasible, the optimization algorithm must deal with all three situations. This is the reason that **MOSEK** solves the so-called homogeneous model

$$\begin{aligned} Ax - b\tau &= 0, \\ A^T y + s - c\tau &= 0, \\ -c^T x + b^T y - \kappa &= 0, \\ x, s, \tau, \kappa &\geq 0, \end{aligned} \tag{11.2}$$

where y and s correspond to the dual variables in (11.1), and τ and κ are two additional scalar variables. Note that the homogeneous model (11.2) always has solution since

$$(x, y, s, \tau, \kappa) = (0, 0, 0, 0, 0)$$

is a solution, although not a very interesting one.

Any solution

$$(x^*, y^*, s^*, \tau^*, \kappa^*)$$

to the homogeneous model (11.2) satisfies

$$x_j^* s_j^* = 0 \text{ and } \tau^* \kappa^* = 0.$$

Moreover, there is always a solution that has the property

$$\tau^* + \kappa^* > 0.$$

First, assume that $\tau^* > 0$. It follows that

$$\begin{aligned} A \frac{x^*}{\tau^*} &= b, \\ A^T \frac{y^*}{\tau^*} + \frac{s^*}{\tau^*} &= c, \\ -c^T \frac{x^*}{\tau^*} + b^T \frac{y^*}{\tau^*} &= 0, \\ x^*, s^*, \tau^*, \kappa^* &\geq 0. \end{aligned}$$

This shows that $\frac{x^*}{\tau^*}$ is a primal optimal solution and $(\frac{y^*}{\tau^*}, \frac{s^*}{\tau^*})$ is a dual optimal solution; this is reported as the optimal interior-point solution since

$$(x, y, s) = \left\{ \frac{x^*}{\tau^*}, \frac{y^*}{\tau^*}, \frac{s^*}{\tau^*} \right\}$$

is a primal-dual optimal solution.

On other hand, if $\kappa^* > 0$ then

$$\begin{aligned} Ax^* &= 0, \\ A^T y^* + s^* &= 0, \\ -c^T x^* + b^T y^* &= \kappa^*, \\ x^*, s^*, \tau^*, \kappa^* &\geq 0. \end{aligned}$$

This implies that at least one of

$$-c^T x^* > 0 \tag{11.3}$$

or

$$b^T y^* > 0 \tag{11.4}$$

is satisfied. If (11.3) is satisfied then x^* is a certificate of dual infeasibility, whereas if (11.4) is satisfied then y^* is a certificate of dual infeasibility.

In summary, by computing an appropriate solution to the homogeneous model, all information required for a solution to the original problem is obtained. A solution to the homogeneous model can be computed using a primal-dual interior-point algorithm [And09].

Interior-point Termination Criterion

For efficiency reasons it is not practical to solve the homogeneous model exactly. Hence, an exact optimal solution or an exact infeasibility certificate cannot be computed and a reasonable termination criterion has to be employed.

In every iteration, k , of the interior-point algorithm a trial solution

$$(x^k, y^k, s^k, \tau^k, \kappa^k)$$

to homogeneous model is generated where

$$x^k, s^k, \tau^k, \kappa^k > 0.$$

Whenever the trial solution satisfies the criterion

$$\begin{aligned} \left\| A \frac{x^k}{\tau^k} - b \right\|_{\infty} &\leq \epsilon_p (1 + \|b\|_{\infty}), \\ \left\| A^T \frac{y^k}{\tau^k} + \frac{s^k}{\tau^k} - c \right\|_{\infty} &\leq \epsilon_d (1 + \|c\|_{\infty}), \text{ and} \\ \min \left(\frac{(x^k)^T s^k}{(\tau^k)^2}, \left| \frac{c^T x^k}{\tau^k} - \frac{b^T y^k}{\tau^k} \right| \right) &\leq \epsilon_g \max \left(1, \frac{\min(|c^T x^k|, |b^T y^k|)}{\tau^k} \right), \end{aligned} \quad (11.5)$$

the interior-point optimizer is terminated and

$$\frac{(x^k, y^k, s^k)}{\tau^k}$$

is reported as the primal-dual optimal solution. The interpretation of (11.5) is that the optimizer is terminated if

- $\frac{x^k}{\tau^k}$ is approximately primal feasible,
- $\left\{ \frac{y^k}{\tau^k}, \frac{s^k}{\tau^k} \right\}$ is approximately dual feasible, and
- the duality gap is almost zero.

On the other hand, if the trial solution satisfies

$$-\epsilon_i c^T x^k > \frac{\|c\|_{\infty}}{\max(1, \|b\|_{\infty})} \|Ax^k\|_{\infty}$$

then the problem is declared dual infeasible and x^k is reported as a certificate of dual infeasibility. The motivation for this stopping criterion is as follows: First assume that $\|Ax^k\|_{\infty} = 0$; then x^k is an exact certificate of dual infeasibility. Next assume that this is not the case, i.e.

$$\|Ax^k\|_{\infty} > 0,$$

and define

$$\bar{x} := \epsilon_i \frac{\max(1, \|b\|_{\infty})}{\|Ax^k\|_{\infty} \|c\|_{\infty}} x^k.$$

It is easy to verify that

$$\|A\bar{x}\|_{\infty} = \epsilon_i \frac{\max(1, \|b\|_{\infty})}{\|c\|_{\infty}} \text{ and } -c^T \bar{x} > 1,$$

which shows \bar{x} is an approximate certificate of dual infeasibility where ϵ_i controls the quality of the approximation. A smaller value means a better approximation.

Finally, if

$$\epsilon_i b^T y^k > \frac{\|b\|_{\infty}}{\max(1, \|c\|_{\infty})} \|A^T y^k + s^k\|_{\infty}$$

then y^k is reported as a certificate of primal infeasibility.

It is possible to adjust the tolerances ε_p , ε_d , ε_g and ε_i using parameters; see Table 11.1 for details.

Table 11.1: Parameters employed in termination criterion

ToleranceParameter	name
ε_p	<i>MSK_DPAR_INTPNT_TOL_PFEAS</i>
ε_d	<i>MSK_DPAR_INTPNT_TOL_DFEAS</i>
ε_g	<i>MSK_DPAR_INTPNT_TOL_REL_GAP</i>
ε_i	<i>MSK_DPAR_INTPNT_TOL_INFEAS</i>

The default values of the termination tolerances are chosen such that for a majority of problems appearing in practice it is not possible to achieve much better accuracy. Therefore, tightening the tolerances usually is not worthwhile. However, an inspection of (11.5) reveals that quality of the solution is dependent on $\|b\|_\infty$ and $\|c\|_\infty$; the smaller the norms are, the better the solution accuracy.

The interior-point method as implemented by **MOSEK** will converge toward optimality and primal and dual feasibility at the same rate [And09]. This means that if the optimizer is stopped prematurely then it is very unlikely that either the primal or dual solution is feasible. Another consequence is that in most cases all the tolerances, ε_p , ε_d and ε_g , have to be relaxed together to achieve an effect.

In some cases the interior-point method terminates having found a solution not too far from meeting the optimality condition (11.5). A solution is defined as *near optimal* if scaling ε_p , ε_d and ε_g by any number $\varepsilon_n \in [1.0, +\infty]$ conditions (11.5) are satisfied.

A near optimal solution is therefore of lower quality but still potentially valuable. If for instance the solver stalls, i.e. it can make no more significant progress towards the optimal solution, a near optimal solution could be available and be good enough for the user.

The basis identification discussed in Section 11.2.2.2 requires an optimal solution to work well; hence basis identification should be turned off if the termination criterion is relaxed.

To conclude the discussion in this section, relaxing the termination criterion is usually not worthwhile.

Basis Identification

An interior-point optimizer does not return an optimal basic solution unless the problem has a unique primal and dual optimal solution. Therefore, the interior-point optimizer has an optional post-processing step that computes an optimal basic solution starting from the optimal interior-point solution. More information about the basis identification procedure may be found in [AY96]. In the following we provide an overall idea of the procedure.

There are some cases in which a basic solution could be more valuable:

- a basic solution is often more accurate than an interior-point solution,
- a basic solution can be used to warm-start the simplex algorithm in case of reoptimization,
- a basic solution is in general more sparse, i.e. more variables are fixed to zero. This is particularly appealing when solving continuous relaxation of mixed integer problems, as well as in all applications in which sparser solutions are preferred.

To illustrate how the basis identification routine works, we use the following trivial example:

$$\begin{array}{ll} \text{minimize} & x + y \\ \text{subject to} & x + y = 1, \\ & x, y \geq 0. \end{array}$$

It is easy to see that all feasible solutions are also optimal. In particular, there are two basic solutions namely

$$\begin{array}{ll} (x_1^*, y_1^*) &= (1, 0), \\ (x_2^*, y_2^*) &= (0, 1). \end{array}$$

The interior point algorithm will actually converge to the center of the optimal set, i.e. to $(x^*, y^*) = (1/2, 1/2)$ (to see this in **MOSEK** deactivate *Presolve*).

In practice, when the algorithm gets close to the optimal solution, it is possible to construct in polynomial time an initial basis for the simplex algorithm from the current interior point solution. This basis is used to warm-start the simplex algorithm that will provide the optimal basic solution.

In most cases the constructed basis is optimal, or very few iterations are required by the simplex algorithm to make it optimal and hence the final *clean* phase be short. However, in some cases for nasty problems e.g. ill-conditioned problems the additional simplex clean up phase may take of lot a time.

By default **MOSEK** performs a basis identification. However, if a basic solution is not needed, the basis identification procedure can be turned off. The parameters

- `MSK_IPAR_INTPNT_BASIS`,
- `MSK_IPAR_BI_IGNORE_MAX_ITER`, and
- `MSK_IPAR_BI_IGNORE_NUM_ERROR`

control when basis identification is performed.

The type of simplex algorithm to be used can be tuned by the `MSK_IPAR_BI_CLEAN_OPTIMIZER` parameter i.e. primal or dual simplex, and the maximum number of iterations can be set by the `MSK_IPAR_BI_MAX_ITERATIONS`.

Finally, it should be mentioned that there is no guarantee on which basic solution will be returned.

The Interior-point Log

Below is a typical log output from the interior-point optimizer presented:

Optimizer	- threads	:	1						
Optimizer	- solved problem	:	the dual						
Optimizer	- Constraints	:	2						
Optimizer	- Cones	:	0						
Optimizer	- Scalar variables	:	6	conic	:	0			
Optimizer	- Semi-definite variables:	:	0	scalarized	:	0

5	1.3e-008	3.2e-008	2.0e-009	1.00e+000	-7.668000027e+003	-7.668000015e+003	3.2e-008	0.01	
6	1.3e-012	3.2e-012	2.0e-013	1.00e+000	-7.667999994e+003	-7.667999994e+003	3.2e-012	0.01	

The first line displays the number of threads used by the optimizer and second line tells that the optimizer chose to solve the dual problem rather than the primal problem. The next line displays the problem dimensions as seen by the optimizer, and the `Factor...` lines show various statistics. This is followed by the iteration log.

Using the same notation as in Section 11.2.2 the columns of the iteration log have the following meaning:

- ITE: Iteration index.
- PFEAS: $\|Ax^k - b\tau^k\|_\infty$. The numbers in this column should converge monotonically towards to zero but may stall at low level due to rounding errors.
- DFEAS: $\|A^T y^k + s^k - c\tau^k\|_\infty$. The numbers in this column should converge monotonically toward to zero but may stall at low level due to rounding errors.

- **GFEAS**: $|-c^T x^k + b^T y^k - \kappa^k|$. The numbers in this column should converge monotonically toward zero but may stall at low level due to rounding errors.
- **PRSTATUS**: This number converges to 1 if the problem has an optimal solution whereas it converges to -1 if that is not the case.
- **POBJ**: $c^T x^k / \tau^k$. An estimate for the primal objective value.
- **DOBJ**: $b^T y^k / \tau^k$. An estimate for the dual objective value.
- **MU**: $\frac{(x^k)^T s^k + \tau^k \kappa^k}{n+1}$. The numbers in this column should always converge monotonically to zero.
- **TIME**: Time spend since the optimization started.

11.2.3 The simplex Based Optimizer

An alternative to the interior-point optimizer is the simplex optimizer.

The simplex optimizer uses a different method that allows exploiting an initial guess for the optimal solution to reduce the solution time. Depending on the problem it may be faster or slower to use an initial guess; see section 11.2.4 for a discussion.

MOSEK provides both a primal and a dual variant of the simplex optimizer — we will return to this later.

Simplex Termination Criterion

The simplex optimizer terminates when it finds an optimal basic solution or an infeasibility certificate. A basic solution is optimal when it is primal and dual feasible; see Section 10.1 and 10.1.1 for a definition of the primal and dual problem. Due to the fact that computations are performed in finite precision **MOSEK** allows violation of primal and dual feasibility within certain tolerances. The user can control the allowed primal and dual tolerances with the parameters `MSK_DPAR_BASIS_TOL_X` and `MSK_DPAR_BASIS_TOL_S`.

Starting From an Existing Solution

When using the simplex optimizer it may be possible to reuse an existing solution and thereby reduce the solution time significantly. When a simplex optimizer starts from an existing solution it is said to perform a *warm-start*. If the user is solving a sequence of optimization problems by solving the problem, making modifications, and solving again, **MOSEK** will warm-start automatically.

Setting the parameter `MSK_IPAR_OPTIMIZER` to `MSK_OPTIMIZER_FREE_SIMPLEX` instructs **MOSEK** to select automatically between the primal and the dual simplex optimizers. Hence, **MOSEK** tries to choose the best optimizer for the given problem and the available solution.

By default **MOSEK** uses presolve when performing a warm-start. If the optimizer only needs very few iterations to find the optimal solution it may be better to turn off the presolve.

Numerical Difficulties in the Simplex Optimizers

Though **MOSEK** is designed to minimize numerical instability, completely avoiding it is impossible when working in finite precision. **MOSEK** counts a “numerical unexpected behavior” event inside the optimizer as a *set-back*. The user can define how many set-backs the optimizer accepts; if that number is exceeded, the optimization will be aborted. Set-backs are implemented to avoid long sequences where the optimizer tries to recover from an unstable situation.

Set-backs are, for example, repeated singularities when factorizing the basis matrix, repeated loss of feasibility, degeneracy problems (no progress in objective) and other events indicating numerical difficulties. If the simplex optimizer encounters a lot of set-backs the problem is usually badly scaled; in such

a situation try to reformulate into a better scaled problem. Then, if a lot of set-backs still occur, trying one or more of the following suggestions may be worthwhile:

- Raise tolerances for allowed primal or dual feasibility: Hence, increase the value of
 - `MSK_DPAR_BASIS_TOL_X`, and
 - `MSK_DPAR_BASIS_TOL_S`.
- Raise or lower pivot tolerance: Change the `MSK_DPAR_SIMPLEX_ABS_TOL_PIV` parameter.
- Switch optimizer: Try another optimizer.
- Switch off crash: Set both `MSK_IPAR_SIM_PRIMAL_CRASH` and `MSK_IPAR_SIM_DUAL_CRASH` to 0.
- Experiment with other pricing strategies: Try different values for the parameters
 - `MSK_IPAR_SIM_PRIMAL_SELECTION` and
 - `MSK_IPAR_SIM_DUAL_SELECTION`.
- If you are using warm-starts, in rare cases switching off this feature may improve stability. This is controlled by the `MSK_IPAR_SIM_HOTSTART` parameter.
- Increase maximum set backs allowed controlled by `MSK_IPAR_SIM_MAX_NUM_SETBACKS`.
- If the problem repeatedly becomes infeasible try switching off the special degeneracy handling. See the parameter `MSK_IPAR_SIM_DEGEN` for details.

11.2.4 The Interior-point or the Simplex Optimizer?

Given a linear optimization problem, which optimizer is the best: The primal simplex, the dual simplex or the interior-point optimizer?

It is impossible to provide a general answer to this question. However, the interior-point optimizer behaves more predictably: it tends to use between 20 and 100 iterations, almost independently of problem size, but cannot perform warm-start, while simplex can take advantage of an initial solution, but is less predictable for cold-start. The interior-point optimizer is used by default.

11.2.5 The Primal or the Dual Simplex Variant?

MOSEK provides both a primal and a dual simplex optimizer. Predicting which simplex optimizer is faster is impossible, however, in recent years the dual optimizer has seen several algorithmic and computational improvements, which, in our experience, makes it faster on average than the primal simplex optimizer. Still, it depends much on the problem structure and size.

Setting the `MSK_IPAR_OPTIMIZER` parameter to `MSK_OPTIMIZER_FREE_SIMPLEX` instructs **MOSEK** to choose which simplex optimizer to use automatically.

To summarize, if you want to know which optimizer is faster for a given problem type, you should try all the optimizers.

11.3 Conic Optimization

11.3.1 The Interior-point Optimizer

For conic optimization problems only an interior-point type optimizer is available. The interior-point optimizer is an implementation of the so-called homogeneous and self-dual algorithm. For a detailed description of the algorithm, please see [\[ART03\]](#).

Interior-point Termination Criteria

The parameters controlling when the conic interior-point optimizer terminates are shown in [Table 11.2](#).

Table 11.2: Parameters employed in termination criterion.

Parameter name	Purpose
<i>MSK_DPAR_INTPNT_CO_TOL_PFEAS</i>	Controls primal feasibility
<i>MSK_DPAR_INTPNT_CO_TOL_DFEAS</i>	Controls dual feasibility
<i>MSK_DPAR_INTPNT_CO_TOL_REL_GAP</i>	Controls relative gap
<i>MSK_DPAR_INTPNT_TOL_INFEAS</i>	Controls when the problem is declared infeasible
<i>MSK_DPAR_INTPNT_CO_TOL_MU_RED</i>	Controls when the complementarity is reduced enough

11.4 Nonlinear Convex Optimization

11.4.1 The Interior-point Optimizer

For quadratic, quadratically constrained, and general convex optimization problems an interior-point type optimizer is available. The interior-point optimizer is an implementation of the homogeneous and self-dual algorithm. For a detailed description of the algorithm, please see [\[AY98\]](#), [\[AY99\]](#).

The Convexity Requirement

Continuous nonlinear problems are required to be convex. For quadratic problems **MOSEK** test this requirement before optimizing. Specifying a non-convex problem results in an error message.

The following parameters are available to control the convexity check:

- *MSK_IPAR_CHECK_CONVEXITY*: Turn convexity check on/off.
- *MSK_DPAR_CHECK_CONVEXITY_REL_TOL*: Tolerance for convexity check.
- *MSK_IPAR_LOG_CHECK_CONVEXITY*: Turn on more log information for debugging.

The Differentiability Requirement

The nonlinear optimizer in **MOSEK** requires both first order and second order derivatives. This of course implies care should be taken when solving problems involving non-differentiable functions.

For instance, the function

$$f(x) = x^2$$

is differentiable everywhere whereas the function

$$f(x) = \sqrt{x}$$

is only differentiable for $x > 0$. In order to make sure that **MOSEK** evaluates the functions at points where they are differentiable, the function domains must be defined by setting appropriate variable bounds.

In general, if a variable is not ranged **MOSEK** will only evaluate that variable at points strictly within the bounds. Hence, imposing the bound

$$x \geq 0$$

in the case of \sqrt{x} is sufficient to guarantee that the function will only be evaluated in points where it is differentiable.

However, if a function is differentiable on a closed range, specifying the variable bounds is not sufficient. Consider the function

$$f(x) = \frac{1}{x} + \frac{1}{1-x}. \quad (11.6)$$

In this case the bounds

$$0 \leq x \leq 1$$

will not guarantee that **MOSEK** only evaluates the function for x between 0 and 1. To force **MOSEK** to strictly satisfy both bounds on ranged variables set the parameter `MSK_IPAR_INTPNT_STARTING_POINT` to `MSK_STARTING_POINT_SATISFY_BOUNDS`.

For efficiency reasons it may be better to reformulate the problem than to force **MOSEK** to observe ranged bounds strictly. For instance, (11.6) can be reformulated as follows

$$\begin{aligned} f(x) &= \frac{1}{x} + \frac{1}{y} \\ 0 &= 1 - x - y \\ 0 &\leq x \\ 0 &\leq y. \end{aligned}$$

Interior-point Termination Criteria

The parameters controlling when the general convex interior-point optimizer terminates are shown in Table 11.3.

Table 11.3: Parameters employed in termination criteria.

Parameter name	Purpose
<code>MSK_DPAR_INTPNT_NL_TOL_PFEAS</code>	Controls primal feasibility
<code>MSK_DPAR_INTPNT_NL_TOL_DFEAS</code>	Controls dual feasibility
<code>MSK_DPAR_INTPNT_NL_TOL_REL_GAP</code>	Controls relative gap
<code>MSK_DPAR_INTPNT_TOL_INFEAS</code>	Controls when the problem is declared infeasible
<code>MSK_DPAR_INTPNT_NL_TOL_MU_RED</code>	Controls when the complementarity is reduced enough

11.5 Using Multiple Threads in an Optimizer

If multiple cores are available then it is possible for **MOSEK** to take advantage of them to speed up the computation. However, please note the speedup achieved is going to be dependent on the problem characteristics e.g. the size of problem. Typically for smallish problems no speedup is obtained by exploiting multiple cores. In fact forcing **MOSEK** to use one core can increase speed because parallel overhead is avoided.

11.5.1 Thread Safety

The **MOSEK** API is thread-safe provided that a task is only modified or accessed from one thread at any given time. Also accessing two or more separate tasks from threads at the same time is safe. Sharing an environment between threads is safe.

11.5.2 Determinism

The optimizers are run-to-run deterministic which means if a problem is solved twice on the same computer using the same parameter setting and exactly the same input then exactly the same results is obtained. One qualification is that no time limits must be imposed because the time taken to perform an operation on a computer is dependent on many factors such as the current workload.

11.5.3 The Parallelized Interior-point Optimizer

By default the interior-point optimizer exploits multiple cores using multithreading. Hence, big tasks such as large dense matrix multiplication may be divided into several independent smaller tasks that can be computed independently. However, there is a computational overhead associated with exploiting multiple threads e.g. cost of the additional coordination etc. Therefore, it may be advantageous to turn off the multithreading for smallish problem using the parameter `MSK_IPAR_INTPNT_MULTI_THREAD`.

Moreover, when the interior-point optimizer is allowed to exploit multiple threads, then the parameter `MSK_IPAR_NUM_THREADS` controls the maximum number of threads (and therefore the number of cores) that **MOSEK** will employ.

THE OPTIMIZER FOR MIXED-INTEGER PROBLEMS

A problem is a mixed-integer optimization problem when one or more of the variables are constrained to be integer valued. **MOSEK** can solve mixed-integer

- linear,
- quadratic and quadratically constrained, and
- conic quadratic

problems.

Readers unfamiliar with integer optimization are recommended to consult some relevant literature, e.g. the book [Wol98] by Wolsey.

12.1 Some Concepts and Facts Related to Mixed-integer Optimization

It is important to understand that in a worst-case scenario, the time required to solve integer optimization problems grows exponentially with the size of the problem. For instance, assume that a problem contains n binary variables, then the time required to solve the problem in the worst case may be proportional to 2^n . The value of 2^n is huge even for moderate values of n .

In practice this implies that the focus should be on computing a near optimal solution quickly rather than on locating an optimal solution. Even if the problem is only solved approximately, it is important to know how far the approximate solution is from an optimal one. In order to say something about the quality of an approximate solution the concept of *relaxation* is important.

The mixed-integer optimization problem

$$\begin{aligned} z^* = \quad & \text{minimize} && c^T x \\ & \text{subject to} && Ax = b, \\ & && x \geq 0 \\ & && x_j \in \mathbb{Z}, \quad \forall j \in \mathcal{J}, \end{aligned} \tag{12.1}$$

has the continuous relaxation

$$\begin{aligned} \underline{z} = \quad & \text{minimize} && c^T x \\ & \text{subject to} && Ax = b, \\ & && x \geq 0 \end{aligned} \tag{12.2}$$

The continuous relaxation is identical to the mixed-integer problem with the restriction that some variables must be integers removed.

There are two important observations about the continuous relaxation. First, the continuous relaxation is usually much faster to optimize than the mixed-integer problem. Secondly if \hat{x} is any feasible solution to (12.1) and

$$\bar{z} := c^T \hat{x}$$

then

$$\underline{z} \leq z^* \leq \bar{z}.$$

This is an important observation since if it is only possible to find a near optimal solution within a reasonable time frame then the quality of the solution can nevertheless be evaluated. The value \underline{z} is a lower bound on the optimal objective value. This implies that the obtained solution is no further away from the optimum than $\bar{z} - \underline{z}$ in terms of the objective value.

Whenever a mixed-integer problem is solved **MOSEK** reports this lower bound so that the quality of the reported solution can be evaluated.

12.2 The Mixed-integer Optimizer

The mixed-integer optimizer can handle problems with linear, quadratic objective and constraints and conic constraints. However, a problem can not contain both quadratic objective or constraints and conic constraints.

The mixed-integer optimizer is specialized for solving linear and conic optimization problems. It can also solve pure quadratic and quadratically constrained problems; these problems are automatically converted to conic problems before being solved.

The mixed-integer optimizer is run-to-run deterministic. This means that if a problem is solved twice on the same computer with identical options then the obtained solution will be bit-for-bit identical for the two runs. However, if a time limit is set then this may not be case since the time taken to solve a problem is not deterministic. The mixed-integer optimizer is parallelized i.e. it can exploit multiple cores during the optimization.

The solution process can be split into these phases:

1. **Presolve:** In this phase the optimizer tries to reduce the size of the problem and improve the formulation using preprocessing techniques. The presolve stage can be turned off using the `MSK_IPAR_PRESOLVE_USE` parameter
2. **Cut generation:** Valid inequalities (cuts) are added to improve the lower bound
3. **Heuristic:** Using heuristics the optimizer tries to guess a good feasible solution. Heuristics can be controlled by the parameter `MSK_IPAR_MIO_HEURISTIC_LEVEL`
4. **Search:** The optimal solution is located by branching on integer variables

12.3 Termination Criterion

In general, it is time consuming to find an exact feasible and optimal solution to an integer optimization problem, though in many practical cases it may be possible to find a sufficiently good solution. Therefore, the mixed-integer optimizer employs a relaxed feasibility and optimality criterion to determine when a satisfactory solution is located.

A candidate solution that is feasible for the continuous relaxation is said to be an integer feasible solution if the criterion

$$\min(x_j - \lfloor x_j \rfloor, \lceil x_j \rceil - x_j) \leq \delta_1 \quad \forall j \in \mathcal{J}$$

is satisfied, meaning that x_j is at most δ_1 from the nearest integer.

Whenever the integer optimizer locates an integer feasible solution it will check if the criterion

$$\bar{z} - \underline{z} \leq \max(\delta_2, \delta_3 \max(10^{-10}, |\bar{z}|))$$

is satisfied. If this is the case, the integer optimizer terminates and reports the integer feasible solution as an optimal solution. Please note that \underline{z} is a valid lower bound determined by the integer optimizer during the solution process, i.e.

$$\underline{z} \leq z^*.$$

The lower bound \underline{z} normally increases during the solution process.

12.3.1 Relaxed Termination

If an optimal solution cannot be located within a reasonable time, it may be advantageous to employ a relaxed termination criterion after some time. Whenever the integer optimizer locates an integer feasible solution and has spent at least the number of seconds defined by the *MSK_DPAR_MIO_DISABLE_TERM_TIME* parameter on solving the problem, it will check whether the criterion

$$\bar{z} - \underline{z} \leq \max(\delta_4, \delta_5 \max(10^{-10}, |\bar{z}|))$$

is satisfied. If it is satisfied, the optimizer will report that the candidate solution is **near optimal** and then terminate. Please note that since this criterion depends on timing, the optimizer will not be run to run deterministic.

12.4 Parameters Affecting the Termination of the Integer Optimizer.

All δ tolerances can be adjusted using suitable parameters — see Table 12.1.

Table 12.1: Tolerances for the mixed-integer optimizer.

Tolerance	Parameter name
δ_1	<i>MSK_DPAR_MIO_TOL_ABS_RELAX_INT</i>
δ_2	<i>MSK_DPAR_MIO_TOL_ABS_GAP</i>
δ_3	<i>MSK_DPAR_MIO_TOL_REL_GAP</i>
δ_4	<i>MSK_DPAR_MIO_NEAR_TOL_ABS_GAP</i>
δ_5	<i>MSK_DPAR_MIO_NEAR_TOL_REL_GAP</i>

In Table 12.2 some other parameters affecting the integer optimizer termination criterion are shown. Please note that if the effect of a parameter is delayed, the associated termination criterion is applied only after some time, specified by the *MSK_DPAR_MIO_DISABLE_TERM_TIME* parameter.

Table 12.2: Other parameters affecting the integer optimizer termination criterion.

Parameter name	De- layed	Explanation
<i>MSK_IPAR_MIO_MAX_NUM_BRANCHES</i>	Yes	Maximum number of branches allowed.
<i>MSK_IPAR_MIO_MAX_NUM_RELAXS</i>	Yes	Maximum number of relaxations allowed.
<i>MSK_IPAR_MIO_MAX_NUM_SOLUTIONS</i>	Yes	Maximum number of feasible integer solutions allowed.

12.5 How to Speed Up the Solution Process

As mentioned previously, in many cases it is not possible to find an optimal solution to an integer optimization problem in a reasonable amount of time. Some suggestions to reduce the solution time are:

- Relax the termination criterion: In case the run time is not acceptable, the first thing to do is to relax the termination criterion — see Section 12.3 for details.
- Specify a good initial solution: In many cases a good feasible solution is either known or easily computed using problem specific knowledge. If a good feasible solution is known, it is usually worthwhile to use this as a starting point for the integer optimizer.
- Improve the formulation: A mixed-integer optimization problem may be impossible to solve in one form and quite easy in another form. However, it is beyond the scope of this manual to discuss good formulations for mixed-integer problems. For discussions on this topic see for example [Wol98].

12.6 Understanding Solution Quality

To determine the quality of the solution one should check the following:

- The solution status key returned by **MOSEK**
- The *optimality gap*: A measure of how much the located solution can deviate from the optimal solution to the problem
- Feasibility. How much the solution violates the constraints of the problem

The *optimality gap* is a measure for how close the solution is to the optimal solution. The optimality gap is given by

$$\epsilon = |(\text{objective value of feasible solution}) - (\text{objective bound})|.$$

The objective value of the solution is guaranteed to be within ϵ of the optimal solution.

The optimality gap can be retrieved through the solution item `MSK_DINF_MIO_OBJ_ABS_GAP`. Often it is more meaningful to look at the optimality gap normalized with the magnitude of the solution. The relative optimality gap is available in `MSK_DINF_MIO_OBJ_REL_GAP`.

PROBLEM ANALYZER

The problem analyzer prints a detailed survey of the

- linear constraints and objective
- quadratic constraints
- conic constraints
- variables

of the model.

In the initial stages of model formulation the problem analyzer may be used as a quick way of verifying that the model has been built or imported correctly. In later stages it can help revealing special structures within the model that may be used to tune the optimizer's performance or to identify the causes of numerical difficulties.

The problem analyzer is run from the C API using the `task.analyzeproblem`: it produces something similar to the following (this is the problem analyzer's survey of the `aflow30a` problem from the MIPLIB 2003 collection.)

Analyzing the problem

Constraints	Bounds	Variables
upper bd: 421	ranged : all	cont: 421

```

The survey is divided into six different sections, each described below. To keep the presentation short with focus on key elements the analyzer generally attempts to display information on issues relevant for the current model only: E.g., if the model does not have any conic constraints (this is the case in the example above) or any integer variables, those parts of the analysis will not appear.

13.1 General Characteristics

The first part of the survey consists of a brief summary of the model's linear and quadratic constraints (indexed by i) and variables (indexed by j). The summary is divided into three subsections:

Constraints

- **upper bd** The number of upper bounded constraints, $\sum_{j=0}^{n-1} a_{ij}x_j \leq u_i^c$
- **lower bd** The number of lower bounded constraints, $l_i^c \leq \sum_{j=0}^{n-1} a_{ij}x_j$
- **ranged** The number of ranged constraints, $l_i^c \leq \sum_{j=0}^{n-1} a_{ij}x_j \leq u_i^c$
- **fixed** The number of fixed constraints, $l_i^c = \sum_{j=0}^{n-1} a_{ij}x_j = u_i^c$
- **free** The number of free constraints

Bounds

- **upper bd** The number of upper bounded variables, $x_j \leq u_j^x$
- **lower bd** The number of lower bounded variables, $l_k^x \leq x_j$
- **ranged** The number of ranged variables, $l_k^x \leq x_j \leq u_j^x$
- **fixed** The number of fixed variables, $l_k^x = x_j = u_j^x$

- **free** The number of free variables

Variables

- **cont** The number of continuous variables, $x_j \in \mathbb{R}$
- **bin** The number of binary variables, $x_j \in \{0,1\}$
- **int** The number of general integer variables, $x_j \in \mathbb{Z}$

Only constraints, bounds and domains actually in the model will be reported on; if all entities in a section turn out to be of the same kind, the number will be replaced by **all** for brevity.

13.2 Objective

The second part of the survey focuses on (the linear part of) the objective, summarizing the optimization sense and the coefficients' absolute value range and distribution. The number of 0 (zero) coefficients is singled out (if any such variables are in the problem).

The range is displayed using three terms:

- **min** $|c|$ The minimum absolute value among all coefficients
- **min** $|c|>0$ The minimum absolute value among the nonzero coefficients
- **max** $|c|$ The maximum absolute value among the coefficients

If some of these extrema turn out to be equal, the display is shortened accordingly:

- If **min** $|c|$ is greater than zero, the **min** $|c|>0$ term is obsolete and will not be displayed
- If only one or two different coefficients occur this will be displayed using **all** and an explicit listing of the coefficients

The absolute value distribution is displayed as a table summarizing the numbers by orders of magnitude (with a ratio of 10). Again, the number of variables with a coefficient of 0 (if any) is singled out. Each line of the table is headed by an interval (half-open intervals including their lower bounds), and is followed by the number of variables with their objective coefficient in this interval. Intervals with no elements are skipped.

13.3 Linear Constraints

The third part of the survey displays information on the nonzero coefficients of the linear constraint matrix.

Following a brief summary of the matrix dimensions and the number of nonzero coefficients in total, three sections provide further details on how the nonzero coefficients are distributed by row-wise count (**A**_{*i*}), by column-wise count (**A**_{*j*}), and by absolute value (**|A**_{*ij*}). Each section is headed by a brief display of the distribution's range (**min** and **max**), and for the row/column-wise counts the corresponding densities are displayed too (in parentheses).

The distribution tables single out three particularly interesting counts: zero, one, and two nonzeros per row/column; the remaining row/column nonzeros are displayed by orders of magnitude (ratio 2). For each interval the relative and accumulated relative counts are also displayed.

Note that constraints may have both linear and quadratic terms, but the empty rows and columns reported in this part of the survey relate to the linear terms only. If empty rows and/or columns are found in the linear constraint matrix, the problem is analyzed further in order to determine if the corresponding constraints have any quadratic terms or the corresponding variables are used in conic or quadratic constraints.

The distribution of the absolute values, $|A(ij)|$, is displayed just as for the objective coefficients described above.

13.4 Constraint and Variable Bounds

The fourth part of the survey displays distributions for the absolute values of the finite lower and upper bounds for both constraints and variables. The number of bounds at 0 is singled out and, otherwise, displayed by orders of magnitude (with a ratio of 10).

13.5 Quadratic Constraints

The fifth part of the survey displays distributions for the nonzero elements in the gradient of the quadratic constraints, i.e. the nonzero row counts for the column vectors Qx . The table is similar to the tables for the linear constraints' nonzero row and column counts described in the survey's third part.

Note: Quadratic constraints may also have a linear part, but that will be included in the linear constraints survey; this means that if a problem has one or more pure quadratic constraints, part three of the survey will report an equal number of linear constraint rows with 0 (zero) nonzeros. Likewise, variables that appear in quadratic terms only will be reported as empty columns (0 nonzeros) in the linear constraint report.

13.6 Conic Constraints

The last part of the survey summarizes the model's conic constraints. For each of the two types of cones, quadratic and rotated quadratic, the total number of cones are reported, and the distribution of the cones' dimensions are displayed using intervals. Cone dimensions of 2, 3, and 4 are singled out.

ANALYZING INFEASIBLE PROBLEMS

When developing and implementing a new optimization model, the first attempts will often be either infeasible, due to specification of inconsistent constraints, or unbounded, if important constraints have been left out.

In this section we will

- go over an example demonstrating how to locate infeasible constraints using the **MOSEK** infeasibility report tool,
- discuss in more general terms which properties may cause infeasibilities, and
- present the more formal theory of infeasible and unbounded problems.

Furthermore, Section 14.7.1 contains a discussion on a specific method for repairing infeasibility problems where infeasibilities are caused by model parameters rather than errors in the model or the implementation.

14.1 Example: Primal Infeasibility

A problem is said to be *primal infeasible* if no solution exists that satisfies all the constraints of the problem.

As an example of a primal infeasible problem consider the problem of minimizing the cost of transportation between a number of production plants and stores: Each plant produces a fixed number of goods, and each store has a fixed demand that must be met. Supply, demand and cost of transportation per unit are given in Fig. 14.1.

Fig. 14.1: Supply, demand and cost of transportation.

The problem represented in Fig. 14.1 is infeasible, since the total demand

$$2300 = 1100 + 200 + 500 + 500$$

exceeds the total supply

$$2200 = 200 + 1000 + 1000$$

If we denote the number of transported goods from plant i to store j by x_{ij} , the problem can be formulated as the LP:

$$\begin{array}{llllllllllll}
 \text{minimize} & x_{11} & + & 2x_{12} & + & 5x_{23} & + & 2x_{24} & + & x_{31} & + & 2x_{33} & + & x_{34} \\
 \text{subject to} & x_{11} & + & x_{12} & & & & & & & & & & & \leq 200, \\
 & & & & & x_{23} & + & x_{24} & & & & & & & \leq 1000, \\
 & & & & & & & & x_{31} & + & x_{33} & + & x_{34} & \leq 1000, \\
 & x_{11} & & & & & & & + & x_{31} & & & & = 1100, \\
 & & x_{12} & & & & & & & & & & & = 200, \\
 & & & & x_{23} & + & & & & & & x_{33} & & = 500, \\
 & & & & & x_{24} & + & & & & & & x_{34} & = 500, \\
 & x_{ij} & \geq 0. & & & & & & & & & & &
 \end{array} \tag{14.1}$$

Solving problem (14.1) using **MOSEK** will result in a solution, a solution status and a problem status. Among the log output from the execution of **MOSEK** on the above problem are the lines:

```
Basic solution
Problem status : PRIMAL_INFEASIBLE
Solution status : PRIMAL_INFEASIBLE_CER
```

The first line indicates that the problem status is primal infeasible. The second line says that a *certificate of the infeasibility* was found. The certificate is returned in place of the solution to the problem.

14.2 Locating the cause of Primal Infeasibility

Usually a primal infeasible problem status is caused by a mistake in formulating the problem and therefore the question arises: *What is the cause of the infeasible status?* When trying to answer this question, it is often advantageous to follow these steps:

- Remove the objective function. This does not change the infeasibility status but simplifies the problem, eliminating any possibility of issues related to the objective function.
- Consider whether your problem has some necessary conditions for feasibility and examine if these are satisfied, e.g. total supply should be greater than or equal to total demand.
- Verify that coefficients and bounds are reasonably sized in your problem.

If the problem is still primal infeasible, some of the constraints must be relaxed or removed completely. The **MOSEK** infeasibility report (Section 14.4) may assist you in finding the constraints causing the infeasibility.

Possible ways of relaxing your problem include:

- Increasing (decreasing) upper (lower) bounds on variables and constraints.
- Removing suspected constraints from the problem.

Returning to the transportation example, we discover that removing the fifth constraint

$$x_{12} = 200$$

makes the problem feasible.

14.3 Locating the Cause of Dual Infeasibility

A problem may also be *dual infeasible*. In this case the primal problem is often unbounded, meaning that feasible solutions exist such that the objective tends towards infinity. An example of a dual infeasible and primal unbounded problem is:

$$\begin{array}{ll}\text{minimize} & x_1 \\ \text{subject to} & x_1 \leq 5.\end{array}$$

To resolve a dual infeasibility the primal problem must be made more restricted by

- Adding upper or lower bounds on variables or constraints.
- Removing variables.
- Changing the objective.

14.3.1 A cautionary note

The problem

$$\begin{array}{ll}\text{minimize} & 0 \\ \text{subject to} & 0 \leq x_1, \\ & x_j \leq x_{j+1}, \quad j = 1, \dots, n-1, \\ & x_n \leq -1\end{array}$$

is clearly infeasible. Moreover, if any one of the constraints is dropped, then the problem becomes feasible.

This illustrates the worst case scenario where all, or at least a significant portion of the constraints are involved in causing infeasibility. Hence, it may not always be easy or possible to pinpoint a few constraints responsible for infeasibility.

14.4 The Infeasibility Report

MOSEK includes functionality for diagnosing the cause of a primal or a dual infeasibility. It can be turned on by setting the `MSK_IPAR_INFEAS_REPORT_AUTO` to `MSK_ON`. This causes **MOSEK** to print a report on variables and constraints involved in the infeasibility.

The `MSK_IPAR_INFEAS_REPORT_LEVEL` parameter controls the amount of information presented in the infeasibility report. The default value is 1.

14.4.1 Example: Primal Infeasibility

We will keep working with the problem (14.1) written in LP format:

Listing 14.1: The code for problem (14.1).

```
\
\ An example of an infeasible linear problem.
\
minimize
  obj: + 1 x11 + 2 x12
        + 5 x23 + 2 x24
        + 1 x31 + 2 x33 + 1 x34
st
  s0: + x11 + x12      <= 200
  s1: + x23 + x24      <= 1000
  s2: + x31 + x33 + x34 <= 1000
```

```

d1: + x11 + x31      = 1100
d2: + x12            = 200
d3: + x23 + x33      = 500
d4: + x24 + x34      = 500
bounds
end

```

14.4.2 Example: Dual Infeasibility

The following problem is dual to (14.1) and therefore it is dual infeasible.

Listing 14.2: The dual of problem (14.1).

```

maximize + 200 y1 + 1000 y2 + 1000 y3 + 1100 y4 + 200 y5 + 500 y6 + 500 y7
subject to
  x11: y1+y4 < 1
  x12: y1+y5 < 2
  x23: y2+y6 < 5
  x24: y2+y7 < 2
  x31: y3+y4 < 1
  x33: y3+y6 < 2
  x34: y3+y7 < 1
bounds
  -inf <= y1 < 0
  -inf <= y2 < 0
  -inf <= y3 < 0
  y4 free
  y5 free
  y6 free
  y7 free
end

```

This can be verified by proving that

$$(y_1, \dots, y_7) = (-1, 0, -1, 1, 1, 0, 0)$$

is a certificate of dual infeasibility (see Section 10.1.2.2) as we can see from this report:

MOSEK DUAL INFEASIBILITY REPORT.

Problem status: The problem is dual infeasible

The following constraints are involved in the infeasibility.

Index	Name	Activity	Objective	Lower bound	Upper bound
5	x33	-1.000000e+00		NONE	2.000000e+00
6	x34	-1.000000e+00		NONE	1.000000e+00

The following variables are involved in the infeasibility.

Let y^* denote the reported primal solution. **MOSEK** states

- that the problem is *dual infeasible*,
- that the reported solution is a certificate of dual infeasibility, and
- that the infeasibility measure for y^* is approximately zero.

Since the original objective was maximization, we have that $c^T y^* > 0$. See Section 10.1.2 for how to interpret the parameter values in the infeasibility report for a linear program. We see that the variables $y1$, $y3$, $y4$, $y5$ and the constraints $x33$ and $x34$ contribute to infeasibility with non-zero values in the **Activity** column.

One possible strategy to *fix* the infeasibility is to modify the problem so that the certificate of infeasibility becomes invalid. In this case we could do one the following things:

- Add a lower bound on $y3$. This will directly invalidate the certificate of dual infeasibility.
- Increase the object coefficient of $y3$. Changing the coefficients sufficiently will invalidate the inequality $c^T y^* > 0$ and thus the certificate.
- Add lower bounds on $x11$ or $x31$. This will directly invalidate the certificate of infeasibility.

Please note that modifying the problem to invalidate the reported certificate does *not* imply that the problem becomes dual feasible — the reason for infeasibility may simply *move*, resulting a problem that is still infeasible, but for a different reason.

More often, the reported certificate can be used to give a hint about errors or inconsistencies in the model that produced the problem.

14.5 Theory Concerning Infeasible Problems

This section discusses the theory of infeasibility certificates and how **MOSEK** uses a certificate to produce an infeasibility report. In general, **MOSEK** solves the problem

$$\begin{array}{ll} \text{minimize} & c^T x + c^f \\ \text{subject to} & l^c \leq Ax \leq u^c, \\ & l^x \leq x \leq u^x \end{array} \quad (14.2)$$

where the corresponding dual problem is

$$\begin{array}{ll} \text{maximize} & (l^c)^T s_l^c - (u^c)^T s_u^c \\ & + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ \text{subject to} & A^T y + s_l^x - s_u^x = c, \\ & -y + s_l^c - s_u^c = 0, \\ & s_l^c, s_u^c, s_l^x, s_u^x \leq 0. \end{array} \quad (14.3)$$

We use the convention that for any bound that is not finite, the corresponding dual variable is fixed at zero (and thus will have no influence on the dual problem). For example

$$l_j^x = -\infty \quad \Rightarrow \quad (s_l^x)_j = 0$$

14.6 The Certificate of Primal Infeasibility

A certificate of primal infeasibility is *any* solution to the homogenized dual problem

$$\begin{array}{ll} \text{maximize} & (l^c)^T s_l^c - (u^c)^T s_u^c \\ & + (l^x)^T s_l^x - (u^x)^T s_u^x \\ \text{subject to} & A^T y + s_l^x - s_u^x = 0, \\ & -y + s_l^c - s_u^c = 0, \\ & s_l^c, s_u^c, s_l^x, s_u^x \leq 0. \end{array}$$

with a positive objective value. That is, $(s_l^{c*}, s_u^{c*}, s_l^{x*}, s_u^{x*})$ is a certificate of primal infeasibility if

$$(l^c)^T s_l^{c*} - (u^c)^T s_u^{c*} + (l^x)^T s_l^{x*} - (u^x)^T s_u^{x*} > 0$$

and

$$\begin{aligned} A^T y + s_l^{x*} - s_u^{x*} &= 0, \\ -y + s_l^{c*} - s_u^{c*} &= 0, \\ s_l^{c*}, s_u^{c*}, s_l^{x*}, s_u^{x*} &\leq 0. \end{aligned}$$

The well-known *Farkas Lemma* tells us that (14.2) is infeasible if and only if a certificate of primal infeasibility exists.

Let $(s_l^{c*}, s_u^{c*}, s_l^{x*}, s_u^{x*})$ be a certificate of primal infeasibility then

$$(s_l^{c*})_i > 0 ((s_u^{c*})_i > 0)$$

implies that the lower (upper) bound on the i th constraint is important for the infeasibility. Furthermore,

$$(s_l^{x*})_j > 0 ((s_u^{x*})_j > 0)$$

implies that the lower (upper) bound on the j th variable is important for the infeasibility.

14.7 The certificate of dual infeasibility

A certificate of dual infeasibility is *any* solution to the problem

$$\begin{aligned} &\text{minimize} && c^T x \\ &\text{subject to} && \bar{l}^c \leq Ax \leq \bar{u}^c, \\ & && \bar{l}^x \leq x \leq \bar{u}^x \end{aligned}$$

with negative objective value, where we use the definitions

$$\bar{l}_i^c := \begin{cases} 0, & l_i^c > -\infty, \\ -\infty, & \text{otherwise,} \end{cases}, \quad \bar{u}_i^c := \begin{cases} 0, & u_i^c < \infty, \\ \infty, & \text{otherwise,} \end{cases}$$

and

$$\bar{l}_i^x := \begin{cases} 0, & l_i^x > -\infty, \\ -\infty, & \text{otherwise,} \end{cases} \quad \text{and} \quad \bar{u}_i^x := \begin{cases} 0, & u_i^x < \infty, \\ \infty, & \text{otherwise.} \end{cases}$$

Stated differently, a certificate of dual infeasibility is any x^* such that

$$\begin{aligned} c^T x^* &< 0, \\ \bar{l}^c &\leq Ax^* \leq \bar{u}^c, \\ \bar{l}^x &\leq x^* \leq \bar{u}^x \end{aligned} \tag{14.4}$$

The well-known Farkas Lemma tells us that (14.3) is infeasible if and only if a certificate of dual infeasibility exists.

Note that if x^* is a certificate of dual infeasibility then for any j such that

$$x_j^* \leq 0,$$

variable j is involved in the dual infeasibility.

14.7.1 Primal Feasibility Repair

Section 14.2 discusses how **MOSEK** treats infeasible problems. In particular, it is discussed which information **MOSEK** returns when a problem is infeasible and how this information can be used to pinpoint the cause of the infeasibility.

In this section we discuss how to repair a primal infeasible problem by relaxing the constraints in a controlled way. For the sake of simplicity we discuss the method in the context of linear optimization.

14.7.2 Manual repair

Subsequently we discuss an automatic method for repairing an infeasible optimization problem. However, it should be observed that the best way to repair an infeasible problem usually depends on what the optimization problem models. For instance in many optimization problem it does not make sense to relax the constraints $x \geq 0$ e.g. it is not possible to produce a negative quantity. Hence, whatever automatic method **MOSEK** provides it will never be as good as a method that exploits knowledge about what is being modelled. This implies that it is usually better to remove the underlying cause of infeasibility at the modelling stage.

Indeed consider the example

$$\begin{array}{llllll}
 \text{minimize} & & & & & \\
 \text{subject to} & x_1 & + & x_2 & & = & 1, \\
 & & & & x_3 & + & x_4 & = & 1, \\
 & - & x_1 & & - & x_3 & & = & -1 + \varepsilon \\
 & & - & x_2 & & - & x_4 & = & -1, \\
 & x_1, & & x_2, & & x_3, & & x_4 & \geq & 0
 \end{array}$$

then if we add the equalities together we obtain the implied equality

$$0 = \varepsilon$$

which is infeasible for any $\varepsilon \geq 0$. Here the infeasibility is caused by a linear dependency in the constraint matrix and that the right-hand side does not match if $\varepsilon \geq 0$.

Observe even if the problem is feasible then just a tiny perturbation to the right-hand side will make the problem infeasible. Therefore, even though the problem can be repaired then a much more robust solution is to avoid problems with linear dependent constraints. Indeed if a problem contains linear dependencies then the problem is either infeasible or contains redundant constraints. In the above case any of the equality constraints can be removed while not changing the set of feasible solutions.

To summarize linear dependencies in the constraints can give rise to infeasible problems and therefore it is better to avoid them. Note that most network flow models usually is formulated with one linear dependent constraint.

Next consider the problem

$$\begin{array}{llll}
 \text{minimize} & & & \\
 \text{subject to} & x_1 - 0.01x_2 & = & 0 \\
 & x_2 - 0.01x_3 & = & 0 \\
 & x_3 - 0.01x_4 & = & 0 \\
 & x_1 & \geq & -1.0e - 9 \\
 & x_1 & \geq & 1.0e - 9 \\
 & x_4 & \geq & -1.0e - 4
 \end{array}$$

Now the **MOSEK** presolve for the sake of efficiency fix variables (and constraints) that has tight bounds where tightness is controlled by the parameter `MSK_DPAR_PRESOLVE_TOL_X`. Since, the bounds

$$-1.0e - 9 \leq x_1 \leq 1.0e - 9$$

are tight then the **MOSEK** presolve will fix variable x_1 at the mid point between the bounds i.e. at 0. It easy to see that this implies $x_4 = 0$ too which leads to the incorrect conclusion that the problem is infeasible. Observe tiny change of the size $1.0e-9$ make the problem switch from feasible to infeasible. Such a problem is inherently unstable and is hard to solve. We normally call such a problem ill-posed.

In general it is recommended to avoid ill-posed problems, but if that is not possible then one solution to this issue is to reduce the parameter to say `MSK_DPAR_PRESOLVE_TOL_X` to say $1.0e-10$. This will at least make sure that the presolve does not make the wrong conclusion.

Automatic Repair

In this section we will describe the idea behind a method that automatically can repair an infeasible problem. The main idea can be described as follows. Consider the linear optimization problem with m constraints and n variables

$$\begin{array}{ll} \text{minimize} & c^T x + c^f \\ \text{subject to} & l^c \leq Ax \leq u^c, \\ & l^x \leq x \leq u^x, \end{array}$$

which is assumed to be infeasible.

One way of making the problem feasible is to reduce the lower bounds and increase the upper bounds. If the change is sufficiently large the problem becomes feasible. Now an obvious idea is to compute the optimal relaxation by solving an optimization problem. The problem

$$\begin{array}{ll} \text{minimize} & p(v_l^c, v_u^c, v_l^x, v_u^x) \\ \text{subject to} & l^c \leq Ax + v_l^c - v_u^c \leq u^c, \\ & l^x \leq x + v_l^x - v_u^x \leq u^x, \\ & v_l^c, v_u^c, v_l^x, v_u^x \geq 0 \end{array} \quad (14.5)$$

does exactly that. The additional variables $(v_l^c)_i$, $(v_u^c)_i$, $(v_l^x)_j$ and $(v_u^x)_j$ are *elasticity* variables because they allow a constraint to be violated and hence add some elasticity to the problem. For instance, the elasticity variable $(v_l^c)_i$ controls how much the lower bound $(l^c)_i$ should be relaxed to make the problem feasible. Finally, the so-called penalty function

$$p(v_l^c, v_u^c, v_l^x, v_u^x)$$

is chosen so it penalize changes to bounds. Given the weights

- $w_l^c \in \mathbb{R}^m$ (associated with l^c),
- $w_u^c \in \mathbb{R}^m$ (associated with u^c),
- $w_l^x \in \mathbb{R}^n$ (associated with l^x),
- $w_u^x \in \mathbb{R}^n$ (associated with u^x),

then a natural choice is

$$p(v_l^c, v_u^c, v_l^x, v_u^x) = (w_l^c)^T v_l^c + (w_u^c)^T v_u^c + (w_l^x)^T v_l^x + (w_u^x)^T v_u^x.$$

Hence, the penalty function $p()$ is a weighted sum of the relaxation and therefore the problem (14.5) keeps the amount of relaxation at a minimum. Please observe that

- the problem (14.5) is always feasible.
- a negative weight implies problem (14.5) is unbounded. For this reason if the value of a weight is negative **MOSEK** fixes the associated elasticity variable to zero. Clearly, if one or more of the weights are negative may imply that it is not possible repair the problem.

A simple choice of weights is to let them all to be 1, but of course that does not take into account that constraints may have different importance.

Caveats

Observe if the infeasible problem

$$\begin{array}{ll} \text{minimize} & x + z \\ \text{subject to} & x = -1, \\ & x \geq 0 \end{array}$$

is repaired then it will be unbounded. Hence, a repaired problem may not have an optimal solution.

Another and more important caveat is that only a minimal repair is performed i.e. the repair that just make the problem feasible. Hence, the repaired problem is barely feasible and that sometimes make the repaired problem hard to solve.

14.7.3 Feasibility Repair

MOSEK includes a function that repair an infeasible problem using the idea described in the previous section simply by passing a set of weights to **MOSEK**. This can be used for linear and conic optimization problems, possibly having integer constrained variables.

An example

Consider the example linear optimization

$$\begin{aligned}
 &\text{minimize} && -10x_1 && && -9x_2, \\
 &\text{subject to} && 7/10x_1 &+& 1x_2 &\geq 630, \\
 & && 1/2x_1 &+& 5/6x_2 &\geq 600, \\
 & && 1x_1 &+& 2/3x_2 &\geq 708, \\
 & && 1/10x_1 &+& 1/4x_2 &\geq 135, \\
 & && x_1, && x_2 &\geq 0, \\
 & && && & x_2 \geq 650
 \end{aligned} \tag{14.6}$$

which is infeasible. Now suppose we wish to use **MOSEK** to suggest a modification to the bounds that makes the problem feasible.

The function `task.primalrepair` can be used to repair an infeasible problem. Details about the function `task.primalrepair` can be seen in the reference.

Listing 14.3: An example of feasibility repair applied to problem (14.6).

```

#include <math.h>
#include <stdio.h>

#include "mosek.h"

static void MSKAPI printstr(void *handle,
                           const char str[])
{
    fputs(str, stdout);
} /* printstr */

int main(int argc, const char *argv[])
{
    const char *filename = "../data/feasrepair.lp";
    MSKenv_t    env;
    MSKrescode_t r;
    MSKtask_t   task;

    if (argc > 1)
        filename = argv[1];

    r = MSK_makeenv(&env, NULL);

    if (r == MSK_RES_OK)
        r = MSK_makeemptytask(env, &task);

    if (r == MSK_RES_OK)
        MSK_linkfunctotaskstream(task, MSK_STREAM_LOG, NULL, printstr);

    if (r == MSK_RES_OK)
        r = MSK_readdata(task, filename); /* Read file from current dir */

    if (r == MSK_RES_OK)
        r = MSK_putintparam(task, MSK_IPAR_LOG_FEAS_REPAIR, 3);
}

```

```
if ( r==MSK_RES_OK )
{
    /* Weights are NULL implying all weights are 1. */
    r = MSK_primalrepair(task,NULL,NULL,NULL,NULL);
}

if ( r==MSK_RES_OK )
{
    double sum_viol;

    r = MSK_getdouinf(task,MSK_DINF_PRIMAL_REPAIR_PENALTY_OBJ,&sum_viol);

    if ( r==MSK_RES_OK )
    {
        printf("Minimized sum of violations = %e\n",sum_viol);

        r = MSK_optimize(task); /* Optimize the repaired task. */

        MSK_solutionsummary(task,MSK_STREAM_MSG);
    }
}

printf("Return code: %d\n",r);

return ( r );
}
```

will produce the following

```

reports the optimal repair. In this case it is to increase the upper bound on constraint `c4` by $1.35e2$ and decrease the lower bound on variable `x2` by 20 .

SENSITIVITY ANALYSIS

Given an optimization problem it is often useful to obtain information about how the optimal objective value changes when the problem parameters are perturbed. E.g, assume that a bound represents the capacity of a machine. Now, it may be possible to expand the capacity for a certain cost and hence it is worthwhile knowing what the value of additional capacity is. This is precisely the type of questions the sensitivity analysis deals with.

Analyzing how the optimal objective value changes when the problem data is changed is called *sensitivity analysis*.

References

The book [Chv83] discusses the classical sensitivity analysis in Chapter 10 whereas the book [RTV97] presents a modern introduction to sensitivity analysis. Finally, it is recommended to read the short paper [Wal00] to avoid some of the pitfalls associated with sensitivity analysis.

Warning: Currently, sensitivity analysis is only available for continuous linear optimization problems. Moreover, **MOSEK** can only deal with perturbations of bounds and objective function coefficients.

15.1 Sensitivity Analysis for Linear Problems

15.1.1 The Optimal Objective Value Function

Assume that we are given the problem

$$\begin{aligned} z(l^c, u^c, l^x, u^x, c) = & \text{minimize} && c^T x \\ & \text{subject to} && l^c \leq Ax \leq u^c, \\ & && l^x \leq x \leq u^x, \end{aligned} \quad (15.1)$$

and we want to know how the optimal objective value changes as l_i^c is perturbed. To answer this question we define the perturbed problem for l_i^c as follows

$$\begin{aligned} f_{l_i^c}(\beta) = & \text{minimize} && c^T x \\ & \text{subject to} && l^c + \beta e_i \leq Ax \leq u^c, \\ & && l^x \leq x \leq u^x, \end{aligned}$$

where e_i is the i -th column of the identity matrix. The function

$$f_{l_i^c}(\beta) \quad (15.2)$$

shows the optimal objective value as a function of β . Please note that a change in β corresponds to a perturbation in l_i^c and hence (15.2) shows the optimal objective value as a function of varying l_i^c with the other bounds fixed.

It is possible to prove that the function (15.2) is a piecewise linear and convex function, i.e. its graph may look like in Fig. 15.1 and Fig. 15.2.

Fig. 15.1: $\beta = 0$ is in the interior of linearity interval.

Clearly, if the function $f_{l_i^c}(\beta)$ does not change much when β is changed, then we can conclude that the optimal objective value is insensitive to changes in l_i^c . Therefore, we are interested in the rate of change in $f_{l_i^c}(\beta)$ for small changes in β — specifically the gradient

$$f'_{l_i^c}(0),$$

which is called the *shadow price* related to l_i^c . The shadow price specifies how the objective value changes for small changes of β around zero. Moreover, we are interested in the *linearity interval*

$$\beta \in [\beta_1, \beta_2]$$

for which

$$f'_{l_i^c}(\beta) = f'_{l_i^c}(0).$$

Since $f_{l_i^c}$ is not a smooth function $f'_{l_i^c}$ may not be defined at 0, as illustrated in Fig. 15.2. In this case we can define a left and a right shadow price and a left and a right linearity interval.

The function $f_{l_i^c}$ considered only changes in l_i^c . We can define similar functions for the remaining parameters of the z defined in (15.1) as well:

$$\begin{aligned} f_{l_i^c}(\beta) &= z(l^c + \beta e_i, u^c, l^x, u^x, c), & i &= 1, \dots, m, \\ f_{u_i^c}(\beta) &= z(l^c, u^c + \beta e_i, l^x, u^x, c), & i &= 1, \dots, m, \\ f_{l_j^x}(\beta) &= z(l^c, u^c, l^x + \beta e_j, u^x, c), & j &= 1, \dots, n, \\ f_{u_j^x}(\beta) &= z(l^c, u^c, l^x, u^x + \beta e_j, c), & j &= 1, \dots, n, \\ f_{c_j}(\beta) &= z(l^c, u^c, l^x, u^x, c + \beta e_j), & j &= 1, \dots, n. \end{aligned}$$

Given these definitions it should be clear how linearity intervals and shadow prices are defined for the parameters u_i^c etc.

Fig. 15.2: $\beta = 0$ is a breakpoint.

Equality Constraints

In **MOSEK** a constraint can be specified as either an equality constraint or a ranged constraint. If some constraint e_i^c is an equality constraint, we define the optimal value function for this constraint as

$$f_{e_i^c}(\beta) = z(l^c + \beta e_i, u^c + \beta e_i, l^x, u^x, c)$$

Thus for an equality constraint the upper and the lower bounds (which are equal) are perturbed simultaneously. Therefore, **MOSEK** will handle sensitivity analysis differently for a ranged constraint with $l_i^c = u_i^c$ and for an equality constraint.

15.1.2 The Basis Type Sensitivity Analysis

The classical sensitivity analysis discussed in most textbooks about linear optimization, e.g. [Chv83], is based on an optimal basic solution or, equivalently, on an optimal basis. This method may produce misleading results [RTV97] but is **computationally cheap**. Therefore, and for historical reasons, this method is available in **MOSEK**.

We will now briefly discuss the basis type sensitivity analysis. Given an optimal basic solution which provides a partition of variables into basic and non-basic variables, the basis type sensitivity analysis computes the linearity interval $[\beta_1, \beta_2]$ so that the basis remains optimal for the perturbed problem. A shadow price associated with the linearity interval is also computed. However, it is well-known that an optimal basic solution may not be unique and therefore the result depends on the optimal basic solution employed in the sensitivity analysis. This implies that the computed interval is only a subset of the largest interval for which the shadow price is constant. Furthermore, the optimal objective value function might have a breakpoint for $\beta = 0$. In this case the basis type sensitivity method will only provide a subset of either the left or the right linearity interval.

In summary, the basis type sensitivity analysis is computationally cheap but does not provide complete information. Hence, the results of the basis type sensitivity analysis should be used with care.

15.1.3 The Optimal Partition Type Sensitivity Analysis

Another method for computing the complete linearity interval is called the *optimal partition type sensitivity analysis*. The main drawback of the optimal partition type sensitivity analysis is that it is computationally expensive compared to the basis type analysis. This type of sensitivity analysis is currently provided as an experimental feature in **MOSEK**.

Given the optimal primal and dual solutions to (15.1), i.e. x^* and $((s_l^c)^*, (s_u^c)^*, (s_l^x)^*, (s_u^x)^*)$ the optimal objective value is given by

$$z^* := c^T x^*.$$

The left and right shadow prices σ_1 and σ_2 for l_i^c are given by this pair of optimization problems:

$$\begin{aligned} \sigma_1 = \text{minimize} \quad & e_i^T s_l^c \\ \text{subject to} \quad & A^T(s_l^c - s_u^c) + s_l^x - s_u^x = c, \\ & (l^c)^T(s_l^c) - (u^c)^T(s_u^c) + (l^x)^T(s_l^x) - (u^x)^T(s_u^x) = z^*, \\ & s_l^c, s_u^c, s_l^x, s_u^x \geq 0 \end{aligned}$$

and

$$\begin{aligned} \sigma_2 = \text{maximize} \quad & e_i^T s_l^c \\ \text{subject to} \quad & A^T(s_l^c - s_u^c) + s_l^x - s_u^x = c, \\ & (l^c)^T(s_l^c) - (u^c)^T(s_u^c) + (l^x)^T(s_l^x) - (u^x)^T(s_u^x) = z^*, \\ & s_l^c, s_u^c, s_l^x, s_u^x \geq 0. \end{aligned}$$

These two optimization problems make it easy to interpret the shadow price. Indeed, if $((s_l^c)^*, (s_u^c)^*, (s_l^x)^*, (s_u^x)^*)$ is an arbitrary optimal solution then

$$(s_l^c)^* \in [\sigma_1, \sigma_2].$$

Next, the linearity interval $[\beta_1, \beta_2]$ for l_i^c is computed by solving the two optimization problems

$$\begin{aligned} \beta_1 = \text{minimize} \quad & \beta \\ \text{subject to} \quad & l^c + \beta e_i \leq Ax \leq u^c, \\ & c^T x - \sigma_1 \beta = z^*, \\ & l^x \leq x \leq u^x, \end{aligned}$$

and

$$\begin{aligned} \beta_2 = \text{maximize} \quad & \beta \\ \text{subject to} \quad & l^c + \beta e_i \leq Ax \leq u^c, \\ & c^T x - \sigma_2 \beta = z^*, \\ & l^x \leq x \leq u^x. \end{aligned}$$

The linearity intervals and shadow prices for u_i^c , l_j^x , and u_j^x are computed similarly to l_i^c .

The left and right shadow prices for c_j denoted σ_1 and σ_2 respectively are computed as follows:

$$\begin{aligned} \sigma_1 = \text{minimize} \quad & e_j^T x \\ \text{subject to} \quad & l^c + \beta e_i \leq Ax \leq u^c, \\ & c^T x = z^*, \\ & l^x \leq x \leq u^x, \end{aligned}$$

and

$$\begin{aligned} \sigma_2 = \text{maximize} \quad & e_j^T x \\ \text{subject to} \quad & l^c + \beta e_i \leq Ax \leq u^c, \\ & c^T x = z^*, \\ & l^x \leq x \leq u^x. \end{aligned}$$

Once again the above two optimization problems make it easy to interpret the shadow prices. Indeed, if x^* is an arbitrary primal optimal solution, then

$$x_j^* \in [\sigma_1, \sigma_2].$$

The linearity interval $[\beta_1, \beta_2]$ for a c_j is computed as follows:

$$\begin{aligned} \beta_1 = & \text{minimize} && \beta \\ & \text{subject to} && A^T(s_l^c - s_u^c) + s_l^x - s_u^x = c + \beta e_j, \\ & && (l^c)^T(s_l^c) - (u^c)^T(s_u^c) + (l^x)^T(s_l^x) - (u^x)^T(s_u^x) - \sigma_1 \beta \leq z^*, \\ & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0 \end{aligned}$$

and

$$\begin{aligned} \beta_2 = & \text{maximize} && \beta \\ & \text{subject to} && A^T(s_l^c - s_u^c) + s_l^x - s_u^x = c + \beta e_j, \\ & && (l^c)^T(s_l^c) - (u^c)^T(s_u^c) + (l^x)^T(s_l^x) - (u^x)^T(s_u^x) - \sigma_2 \beta \leq z^*, \\ & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0. \end{aligned}$$

15.1.4 Example: Sensitivity Analysis

As an example we will use the following transportation problem. Consider the problem of minimizing the transportation cost between a number of production plants and stores. Each plant supplies a number of goods and each store has a given demand that must be met. Supply, demand and cost of transportation per unit are shown in Fig. 15.3.

Fig. 15.3: Supply, demand and cost of transportation.

If we denote the number of transported goods from location i to location j by x_{ij} , problem can be formulated as the linear optimization problem of minimizing

$$1x_{11} + 2x_{12} + 5x_{23} + 2x_{24} + 1x_{31} + 2x_{33} + 1x_{34}$$

subject to

$$\begin{aligned} x_{11} + x_{12} & \leq 400, \\ x_{23} + x_{24} & \leq 1200, \\ x_{31} + x_{33} + x_{34} & \leq 1000, \\ x_{11} + x_{31} & = 800, \\ x_{12} + x_{32} & = 100, \\ x_{23} + x_{33} & = 500, \\ x_{24} + x_{34} & = 500, \\ x_{11}, x_{12}, x_{23}, x_{24}, x_{31}, x_{33}, x_{34} & \geq 0. \end{aligned} \tag{15.3}$$

The sensitivity parameters are shown in Table 15.1 and Table 15.2 for the basis type analysis and in Table 15.3 and Table 15.4 for the optimal partition type analysis.

Table 15.1: Ranges and shadow prices related to bounds on constraints and variables: results for the basis type sensitivity analysis.

Table 15.4: Ranges and shadow prices related to the objective coefficients: results for the optimal partition type sensitivity analysis.

Var.	β_1	β_2	σ_1	σ_2
c_1	$-\infty$	3.00	300.00	300.00
c_2	$-\infty$	∞	100.00	100.00
c_3	-2.00	∞	0.00	0.00
c_4	$-\infty$	2.00	500.00	500.00
c_5	-3.00	∞	500.00	500.00
c_6	$-\infty$	2.00	500.00	500.00
c_7	-2.00	∞	0.00	0.00

Examining the results from the optimal partition type sensitivity analysis we see that for constraint number 1 we have $\sigma_1 = 3$, $\sigma_2 = 1$ and $\beta_1 = -300$, $\beta_2 = 500$. Therefore, we have a left linearity interval of $[-300, 0]$ and a right interval of $[0, 500]$. The corresponding left and right shadow prices are 3 and 1 respectively. This implies that if the upper bound on constraint 1 increases by

$$\beta \in [0, \beta_1] = [0, 500]$$

then the optimal objective value will decrease by the value

$$\sigma_2 \beta = 1\beta.$$

Correspondingly, if the upper bound on constraint 1 is decreased by

$$\beta \in [0, 300]$$

then the optimal objective value will increase by the value

$$\sigma_1 \beta = 3\beta.$$

15.2 Sensitivity Analysis with MOSEK

MOSEK provides the functions `task.primalsensitivity` and `task.dualsensitivity` for performing sensitivity analysis. The code in Listing 15.1 gives an example of its use.

Listing 15.1: Example of sensitivity analysis with the MOSEK Optimizer API for C.

```

#include <stdio.h>

#include "mosek.h" /* Include the MOSEK definition file. */

static void MSKAPI printstr(void *handle,
                             const char str[])
{
    printf("%s",str);
} /* printstr */

int main(int argc,char *argv[])
{
    const MSKint32t numcon=7,
                  numvar=7;
    MSKint32t     i,j;
    MSKboundkeye  bkc[] = {MSK_BK_UP, MSK_BK_UP, MSK_BK_UP, MSK_BK_FX,

API REFERENCE

This section contains the complete reference of the **MOSEK** Optimizer API for C. It is organized as follows:

- *General API conventions.*
- API functionalities
 - *in alphabetic order,*
 - *grouped by topic,*
- *Optimizer parameters*
- *Response codes*
- *Constants*
- *Function types* and *data types* used by **MOSEK**, e.g., in callback functions.

16.1 API Conventions

16.1.1 Naming Conventions for Arguments

In the definition of the **MOSEK** Optimizer API for C a consistent naming convention has been used. This implies that whenever for example `numcon` is an argument in a function definition it indicates the number of constraints. In [Table 16.1](#) the variable names used to specify the problem parameters are listed.

Table 16.1: Naming conventions used in the MOSEK Optimizer API for C.

API name	API type	Dimension	Related problem parameter
numcon	int		m
numvar	int		n
numcone	int		t
numqonz	int		q_{ij}^o
qosubi	int[]	numqonz	q_{ij}^o
qosubj	int[]	numqonz	q_{ij}^o
qoval	double*	numqonz	q_{ij}^o
c	double[]	numvar	c_j
cfix	double		c^f
numqcnz	int		q_{ij}^k
qcsubk	int[]	qcnz	q_{ij}^k
qcsubi	int[]	qcnz	q_{ij}^k
qcsbj	int[]	qcnz	q_{ij}^k
qcval	double*	qcnz	q_{ij}^k
aptrb	int[]	numvar	a_{ij}
aptre	int[]	numvar	a_{ij}
asub	int[]	aptre[numvar-1]	a_{ij}
aval	double[]	aptre[numvar-1]	a_{ij}
bkc	MSKboundkeye*	numcon	l_k^c and u_k^c
blc	double[]	numcon	l_k^c
buc	double[]	numcon	u_k^c
bkc	MSKboundkeye*	numvar	l_k^x and u_k^x
blx	double[]	numvar	l_k^x
bux	double[]	numvar	u_k^x

The relation between the variable names and the problem parameters is as follows:

- The quadratic terms in the objective: $q_{\text{qosubi}[t], \text{qosubj}[t]}^o = \text{qoval}[t]$, $t = 0, \dots, \text{numqonz} - 1$.
- The linear terms in the objective : $c_j = \text{c}[j]$, $j = 0, \dots, \text{numvar} - 1$
- The fixed term in the objective : $c^f = \text{cfix}$.
- The quadratic terms in the constraints: $q_{\text{qcsubi}[t], \text{qcsbj}[t]}^{\text{qcsbk}[t]} = \text{qcval}[t]$, $t = 0, \dots, \text{numqcnz} - 1$
- The linear terms in the constraints: $a_{\text{asub}[t], j} = \text{aval}[t]$, $t = \text{ptrb}[j], \dots, \text{ptre}[j] - 1, j = 0, \dots, \text{numvar} - 1$

The bounds on the constraints are specified using the variables **bkc**, **blc**, and **buc**. The components of the integer array **bkc** specify the bound type according to [Table 16.2](#)

Table 16.2: Symbolic key for variable and constraint bounds.

Symbolic constant	Lower bound	Upper bound
<i>MSK_BK_FX</i>	finite	identical to the lower bound
<i>MSK_BK_FR</i>	minus infinity	plus infinity
<i>MSK_BK_LO</i>	finite	plus infinity
<i>MSK_BK_RA</i>	finite	finite
<i>MSK_BK_UP</i>	minus infinity	finite

For instance **bkc[2]=MSK_BK_LO** means that $-\infty < l_2^c$ and $u_2^c = \infty$. Finally, the numerical values of the bounds are given by

$$l_k^c = \text{blc}[k], \quad k = 0, \dots, \text{numcon} - 1$$

and

$$u_k^c = \text{buc}[k], \quad k = 0, \dots, \text{numcon} - 1.$$

The bounds on the variables are specified using the variables `blkx`, `blx`, and `bux`. The components in the integer array `blkx` specify the bound type according to Table 16.2. The numerical values for the lower bounds on the variables are given by

$$l_j^x = \text{blx}[j], \quad j = 0, \dots, \text{numvar} - 1.$$

The numerical values for the upper bounds on the variables are given by

$$u_j^x = \text{bux}[j], \quad j = 0, \dots, \text{numvar} - 1.$$

Bounds

A bound on a variable or on a constraint in **MOSEK** consists of a *bound key*, as defined in Table 16.2, a lower bound value and an upper bound value. Even if a variable or constraint is bounded only from below, e.g. $x \geq 0$, both bounds are inputted or extracted; the value inputted as upper bound for $(x \geq 0)$ is ignored.

16.1.2 Vector Formats

Three different vector formats are used in the **MOSEK** API:

Full vector

This is simply an array where the first element corresponds to the first item, the second element to the second item etc. For example to get the linear coefficients of the objective in `task`, one would write

```
MSKcrealt * c = MSK_calloctask(task, numvar, sizeof(MSKcrealt));

if ( c )
    res = MSK_getc(task,c);
else
    printf("Out of space\n");
```

where `numvar` is the number of variables in the problem.

Vector slice

A vector slice is a range of values. For example, to get the bounds associated constraint 3 through 10 (both inclusive) one would write

```
MSKcrealt * upper_bound = MSK_calloctask(task,8,sizeof(MSKcrealt));
MSKcrealt * lower_bound = MSK_calloctask(task,8,sizeof(MSKcrealt));
MSKboundkey * bound_key = MSK_calloctask(task,8,sizeof(MSKboundkey));
res = MSK_getboundslice(task,MSK_ACC_CON, 2,10,
                        bound_key,lower_bound,upper_bound);
```

Please note that items in **MOSEK** are numbered from 0, so that the index of the first item is 0, and the index of the n 'th item is $n - 1$.

Sparse vector

A sparse vector is given as an array of indexes and an array of values. For example, to input a set of bounds associated with constraints number 1, 6, 3, and 9, one might write

```

MSKint32t bound_index[] = { 1, 6, 3, 9 };
MSKboundkey bound_key[] = { MSK_BK_FR, MSK_BK_LO, MSK_BK_UP, MSK_BK_FX };
MSKrealt lower_bound[] = { 0.0, -10.0, 0.0, 5.0 };
MSKrealt upper_bound[] = { 0.0, 0.0, 6.0, 5.0 };

res = MSK_putconboundlist(task, 4, bound_index,
                          bound_key, lower_bound, upper_bound);

```

Note that the list of indexes need not be ordered.

16.1.3 Matrix Formats

The coefficient matrices in a problem are inputted and extracted in a sparse format, either as complete or a partial matrices. Basically there are two different formats for this.

Unordered Triplets

In unordered triplet format each entry is defined as a row index, a column index and a coefficient. For example, to input the A matrix coefficients for $a_{1,2} = 1.1$, $a_{3,3} = 4.3$, and $a_{5,4} = 0.2$, one would write as follows:

```

MSKint32t subi[] = { 1, 3, 5 },
             subj[] = { 2, 3, 4 };
MSKrealt cof[] = { 1.1, 4.3, 0.2 };

res = MSK_putaijlist(task, 3, subi, subj, cof);

```

Please note that in some cases (like `task.putaijlist`) *only* the specified indexes remain modified — all other are unchanged. In other cases (such as `task.putqconk`) the triplet format is used to modify *all* entries — entries that are not specified are set to 0.

Column or Row Ordered Sparse Matrix

In a sparse matrix format only the non-zero entries of the matrix are stored. **MOSEK** uses a sparse packed matrix format ordered either by columns or rows. In the column-wise format the position of the non-zeros are given as a list of row indexes. In the row-wise format the position of the non-zeros are given as a list of column indexes. Values of the non-zero entries are given in column or row order.

Column ordered sparse matrix

A sparse matrix in column ordered format consists of:

- **asub**: List of row indexes.
- **aval**: List of non-zero entries of A ordered by columns.
- **ptrb**: Where `ptrb[j]` is the position of the first value/index in **aval** / **asub** for column j .
- **ptre**: Where `ptre[j]` is the position of the last value/index plus one in **aval** / **asub** for column j .

The values of a matrix A with `numcol` columns are assigned so that for

$$j = 0, \dots, \text{numcol} - 1.$$

We define

$$a_{\text{asub}[k],j} = \text{aval}[k], k = \text{ptrb}[j], \dots, \text{ptre}[j] - 1.$$

As an example consider the matrix

$$A = \begin{bmatrix} 1.1 & & 1.3 & 1.4 & & \\ & 2.2 & & & 2.5 & \\ 3.1 & & & 3.4 & & \\ & & 4.4 & & & \end{bmatrix} \quad (16.1)$$

which can be represented in the column ordered sparse matrix format as

$$\begin{aligned} \text{ptrb} &= [0, 2, 3, 5, 7], \\ \text{ptre} &= [2, 3, 5, 7, 8], \\ \text{asub} &= [0, 2, 1, 0, 3, 0, 2, 1], \\ \text{aval} &= [1.1, 3.1, 2.2, 1.3, 4.4, 1.4, 3.4, 2.5]. \end{aligned}$$

Fig. 16.1 illustrates how the matrix A in (16.1) is represented in column ordered sparse matrix format.

Fig. 16.1: The matrix A (16.1) represented in column ordered packed sparse matrix format.

Row ordered sparse matrix

The matrix A (16.1) can also be represented in the row ordered sparse matrix format as:

$$\begin{aligned} \text{ptrb} &= [0, 3, 5, 7], \\ \text{pre} &= [3, 5, 7, 8], \\ \text{asub} &= [0, 2, 3, 1, 4, 0, 3, 2], \\ \text{aval} &= [1.1, 1.3, 1.4, 2.2, 2.5, 3.1, 3.4, 4.4]. \end{aligned}$$

16.3 All functions in alphabetical order

`ret = MSK_analyzenames(task, whichstream, nametype)`

The function analyzes the names and issue an error if a name is invalid.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `nametype` (*MSKnametypee*) – The type of names e.g. valid in MPS or LP files.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_analyzeproblem(task, whichstream)`

The function analyzes the data of task and writes out a report.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_analyzesolution(task, whichstream, whichsol)`

Print information related to the quality of the solution and other solution statistics.

By default this function prints information about the largest infeasibilities in the solution, the primal (and possibly dual) objective value and the solution status.

Following parameters can be used to configure the printed statistics:

- *MSK_IPAR_ANA_SOL_BASIS* enables or disables printing of statistics specific to the basis solution (condition number, number of basic variables etc.). Default is on.
- *MSK_IPAR_ANA_SOL_PRINT_VIOLATED* enables or disables listing names of all constraints (both primal and dual) which are violated by the solution. Default is off.
- *MSK_DPAR_ANA_SOL_INFEAS_TOL* is the tolerance defining when a constraint is considered violated. If a constraint is violated more than this, it will be listed in the summary.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`task.getpviolcon`, `task.getpviolvar`, `task.getpviolbarvar`, `task.getpviolcones`,
`task.getdviolcon`, `task.getdviolvar`, `task.getdviolbarvar`, `task.getdviolcones`,
`MSK_IPAR_ANA_SOL_BASIS`

`ret = MSK_appendbarvars(task, num, dim)`

Appends a positive semidefinite matrix variable of dimension `dim` to the problem.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `num (MSKint32t)` – Number of symmetric matrix variables to be appended.
- [in] `dim (MSKint32t)` – Dimension of symmetric matrix variables to be added.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_appendcone(task, ct, coneapar, nummem, submem)`

Appends a new conic constraint to the problem. Hence, add a constraint

$$\hat{x} \in \mathcal{K}$$

to the problem where \mathcal{K} is a convex cone. \hat{x} is a subset of the variables which will be specified by the argument `submem`.

Depending on the value of `ct` this function appends a normal (`MSK_CT_QUAD`) or rotated quadratic cone (`MSK_CT_RQUAD`).

Define

$$\hat{x} = x_{\text{submem}[0]}, \dots, x_{\text{submem}[\text{nummem}-1]}.$$

Depending on the value of `ct` this function appends one of the constraints:

- Quadratic cone (`MSK_CT_QUAD`) :

$$\hat{x}_0 \geq \sqrt{\sum_{i=1}^{i < \text{nummem}} \hat{x}_i^2}$$

- Rotated quadratic cone (`MSK_CT_RQUAD`) :

$$2\hat{x}_0\hat{x}_1 \geq \sum_{i=2}^{i < \text{nummem}} \hat{x}_i^2, \quad \hat{x}_0, \hat{x}_1 \geq 0$$

Please note that the sets of variables appearing in different conic constraints must be disjoint.

For an explained code example see Section 3.3.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `ct (MSKconetypee)` – Specifies the type of the cone.
- [in] `coneapar (MSKrealt)` – This argument is currently not used. It can be set to 0
- [in] `nummem (MSKint32t)` – Number of member variables in the cone.
- [in] `submem (MSKint32t)` – Variable subscripts of the members in the cone.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`task.appendconeseq`, `task.appendconeseq`

```
ret = MSK_appendconeseq(task, ct, coneapar, nummem, j)
```

Appends a new conic constraint to the problem. The function assumes the members of cone are sequential where the first member has index j and the last $j+\text{nummem}-1$.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `ct` (*MSKconetypee*) – Specifies the type of the cone.
- [in] `coneapar` (*MSKrealt*) – This argument is currently not used. It can be set to 0
- [in] `nummem` (*MSKint32t*) – Dimension of the conic constraint to be appended.
- [in] `j` (*MSKint32t*) – Index of the first variable in the conic constraint.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.appendcone`, `task.appendconeseq`

```
ret = MSK_appendconesseq(task, num, ct, coneapar, nummem, j)
```

Appends a number conic constraints to the problem. The k th cone is assumed to be of dimension `nummem[k]`. Moreover, is assumed that the first variable of the first cone has index j and the index of the variable in each cone are sequential. Finally, it assumed in the second cone is the last index of first cone plus one and so forth.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of cones to be added.
- [in] `ct` (*MSKconetypee*) – Specifies the type of the cone.
- [in] `coneapar` (*MSKrealt*) – This argument is currently not used. It can be set to 0
- [in] `nummem` (*MSKint32t*) – Number of member variables in the cone.
- [in] `j` (*MSKint32t*) – Index of the first variable in the first cone to be appended.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.appendcone`, `task.appendconeseq`

```
ret = MSK_appendcons(task, num)
```

Appends a number of constraints to the model. Appended constraints will be declared free. Please note that **MOSEK** will automatically expand the problem dimension to accommodate the additional constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of constraints which should be appended.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.removecons`

```
ret = MSK_appendsparsesymmat(task, dim, nz, subi, subj, valij, idx)
```

MOSEK maintains a storage of symmetric data matrixes that is used to build the \bar{c} and \bar{A} . The storage can be thought of as a vector of symmetric matrixes denoted E . Hence, E_i is a symmetric matrix of certain dimension.

This function appends a general sparse symmetric matrix on triplet form to the vector E of symmetric matrixes. The vectors `subi`, `subj`, and `valij` contains the row subscripts, column subscripts

and values of each element in the symmetric matrix to be appended. Since the matrix that is appended is symmetric then only the lower triangular part should be specified. Moreover, duplicates are not allowed.

Observe the function reports the index (position) of the appended matrix in E . This index should be used for later references to the appended matrix.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `dim` (*MSKint32t*) – Dimension of the symmetric matrix that is appended.
- [in] `nz` (*MSKint64t*) – Number of triplets.
- [in] `subi` (*MSKint32t*) – Row subscript in the triplets.
- [in] `subj` (*MSKint32t*) – Column subscripts in the triplets.
- [in] `valij` (*MSKrealt*) – Values of each triplet.
- [out] `idx` (*MSKint64t*) – Each matrix that is appended to E is assigned a unique index i.e. `idx` that can be used for later reference.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_appendvars(task, num)`

Appends a number of variables to the model. Appended variables will be fixed at zero. Please note that **MOSEK** will automatically expand the problem dimension to accommodate the additional variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of variables which should be appended.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.removevars`

`ret = MSK_asyncgetresult(task, server, port, token, respavailable, resp, trm)`

Request a response from a remote job. If successful, solver response, termination code and solutions are retrieved.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `server` (*MSKstring_t*) – Name or IP address of the solver server
- [in] `port` (*MSKstring_t*) – Network port of solver service
- [in] `token` (*MSKstring_t*) – The task token
- [out] `respavailable` (*MSKboolean_t*) – Indicates if a remote response is available. If this is not true, `res` and `trm` should be ignored.
- [out] `resp` (*MSKrescodee*) – Is either the response code from from the remote solver.
- [out] `trm` (*MSKrescodee*) – Is either *MSK_RESPONSE_OK* or a termination response code.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.asyncoptimize`, `task.asyncpoll`, `task.asyncgetresult`

`ret = MSK_asyncoptimize(task, server, port, token)`

Offload the optimization task to a solver server defined by `server:port`. The call will return immediately and not wait for the result.

If the string parameter *MSK_SPAR_REMOTE_ACCESS_TOKEN* is not blank, it will be passed to the server as authentication.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] server (*MSKstring_t*) – Name or IP address of the solver server
- [in] port (*MSKstring_t*) – Network port of solver service
- [out] token (*MSKstring_t*) – Returns the task token

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.asyncstop, *task.asyncpoll*, *task.asyncgetresult*, *MSK_SPAR_REMOTE_ACCESS_TOKEN*

ret = MSK_asyncpoll(task, server, port, token, respavailable, resp, trm)

Requests information about the status of the remote job.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] server (*MSKstring_t*) – Name or IP address of the solver server
- [in] port (*MSKstring_t*) – Network port of solver service
- [in] token (*MSKstring_t*) – The task token
- [out] respavailable (*MSKboolean_t*) – Indicates if a remote response is available. If this is not true, res and trm should be ignored.
- [out] resp (*MSKrescodee*) – Is either the response code from from the remote solver.
- [out] trm (*MSKrescodee*) – Is either *MSK_RESPONSE_OK* or a termination response code.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.asyncoptimize, *task.asyncpoll*, *task.asyncgetresult*

ret = MSK_asyncstop(task, server, port, token)

Request that the job identified by the token is terminated.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] server (*MSKstring_t*) – Name or IP address of the solver server
- [in] port (*MSKstring_t*) – Network port of solver service
- [in] token (*MSKstring_t*) – The task token

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.asyncoptimize, *task.asyncpoll*, *task.asyncgetresult*

ret = MSK_axpy(env, n, alpha, x, y)

Adds αx to y .

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] n (*MSKint32t*) – Length of the vectors.
- [in] alpha (*MSKreal_t*) – The scalar that multiplies x .
- [in] x (*MSKreal_t*) – The x vector.
- [io] y (*MSKreal_t*) – The y vector.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_basiscond(task, nrmbasis, nrminvbasis)`

If a basic solution is available and it defines a nonsingular basis, then this function computes the 1-norm estimate of the basis matrix and an 1-norm estimate for the inverse of the basis matrix. The 1-norm estimates are computed using the method outlined in [Ste98], pp. 388-391.

By definition the 1-norm condition number of a matrix B is defined as

$$\mathcal{K}_1(B) := \|B\|_1 \|B^{-1}\|_1.$$

Moreover, the larger the condition number is the harder it is to solve linear equation systems involving B . Given estimates for $\|B\|_1$ and $\|B^{-1}\|_1$ it is also possible to estimate $\kappa_1(B)$.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [out] `nrmbasis (MSKrealt)` – An estimate for the 1 norm of the basis.
- [out] `nrminvbasis (MSKrealt)` – An estimate for the 1 norm of the inverse of the basis.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_bktostr(task, bk, str)`

Obtains an identifier string corresponding to a bound key.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `bk (MSKboundkeye)` – Bound key.
- [out] `str (MSKstring_t)` – String corresponding to the bound key code `bk`.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_callbackcodetostr(code, callbackcodestr)`

Obtains a the string representation of a corresponding to a call-back code.

Parameters

- [in] `code (MSKcallbackcodee)` – A call-back code.
- [out] `callbackcodestr (MSKstring_t)` – String corresponding to the call-back code.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_alloclbgen(env, number, size, file, line)`

Debug version of `env.allocenv`.

Parameters

- [in] `env (MSKenv_t)` – The **MOSEK** environment.
- [in] `number (size_t)` – Number of elements.
- [in] `size (size_t)` – Size of each individual element.
- [in] `file (MSKstring_t)` – File from which the function is called.
- [in] `line (unsigned)` – Line in the file from which the function is called.

Return

- `ret (void*)` – A pointer to the memory allocated through the task.

`ret = MSK_alloclbgtask(task, number, size, file, line)`

Debug version of `task.alloctask`.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] number (*size_t*) – Number of elements.
- [in] size (*size_t*) – Size of each individual element.
- [in] file (*MSKstring_t*) – File from which the function is called.
- [in] line (unsigned) – Line in the file from which the function is called.

Return

- ret (void*) – A pointer to the memory allocated through the task.

ret = MSK_callocenv(env, number, size)

Equivalent to `calloc` i.e. allocate space for an array of length `number` where each element is of size `size`.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] number (*size_t*) – Number of elements.
- [in] size (*size_t*) – Size of each individual element.

Return

- ret (void*) – A pointer to the memory allocated through the environment.

ret = MSK_calloctask(task, number, size)

Equivalent to `calloc` i.e. allocate space for an array of length `number` where each element is of size `size`.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] number (*size_t*) – Number of elements.
- [in] size (*size_t*) – Size of each individual element.

Return

- ret (void*) – A pointer to the memory allocated through the task.

ret = MSK_checkconvexity(task)

This function checks if a quadratic optimization problem is convex. The amount of checking is controlled by *MSK_IPAR_CHECK_CONVEXITY*.

The function reports an error if the problem is not convex.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.

Return

- ret (*MSKrescodee*) – The function response code.

See also

MSK_IPAR_CHECK_CONVEXITY

ret = MSK_checkinall(env)

Check in all unsued license features to the license token server.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_checkinlicense(env, feature)

Check in a license feature to the license server. By default all licenses consumed by functions using a single environment is kept checked out for the lifetime of the **MOSEK** environment. This function checks in a given license feature to the license server immediately.

If the given license feature is not checked out or is in use by a call to *task.optimize* calling this function has no effect.

Please note that returning a license to the license server incurs a small overhead, so frequent calls to this function should be avoided.

Parameters

- [in] *env* (*MSKenv_t*) – The **MOSEK** environment.
- [in] *feature* (*MSKfeaturee*) – Feature to check in to the license system.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_checkmemenv(env, file, line)
```

Checks the memory allocated by the environment.

Parameters

- [in] *env* (*MSKenv_t*) – The **MOSEK** environment.
- [in] *file* (*MSKstring_t*) – File from which the function is called.
- [in] *line* (*MSKint32t*) – Line in the file from which the function is called.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_checkmentask(task, file, line)
```

Checks the memory allocated by the task.

Parameters

- [in] *task* (*MSKtask_t*) – An optimization task.
- [in] *file* (*MSKstring_t*) – File from which the function is called.
- [in] *line* (*MSKint32t*) – Line in the file from which the function is called.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_checkversion(env, major, minor, build, revision)
```

Compares the version of the **MOSEK** DLL with a specified version. Normally the specified version is the version at the build time.

Parameters

- [in] *env* (*MSKenv_t*) – The **MOSEK** environment.
- [in] *major* (*MSKint32t*) – Major version number.
- [in] *minor* (*MSKint32t*) – Minor version number.
- [in] *build* (*MSKint32t*) – Build number.
- [in] *revision* (*MSKint32t*) – Revision number.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_checkoutlicense(env, feature)
```

Check out a license feature from the license server. Normally the required license features will be automatically checked out the first time it is needed by the function *task.optimize*. This function can be used to check out one or more features ahead of time.

The license will remain checked out until the environment is deleted or the function *env.checkinlicense* is called.

If a given feature is already checked out when this function is called, only one feature will be checked out from the license server.

Parameters

- [in] *env* (*MSKenv_t*) – The **MOSEK** environment.

- [in] `feature` (*MSKfeaturee*) – Feature to check out from the license system.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_chgbound(task, accmode, i, lower, finite, value)`

Changes a bound for one constraint or variable. If `accmode` equals *MSK_ACC_CON*, a constraint bound is changed, otherwise a variable bound is changed.

If `lower` is non-zero, then the lower bound is changed as follows:

$$\text{new lower bound} = \begin{cases} -\infty, & \text{finite} = 0, \\ \text{value} & \text{otherwise.} \end{cases}$$

Otherwise if `lower` is zero, then

$$\text{new upper bound} = \begin{cases} \infty, & \text{finite} = 0, \\ \text{value} & \text{otherwise.} \end{cases}$$

Please note that this function automatically updates the bound key for bound, in particular, if the lower and upper bounds are identical, the bound key is changed to **fixed**.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – Defines if operations are performed row-wise (constraint-oriented) or column-wise (variable-oriented).
- [in] `i` (*MSKint32t*) – Index of the constraint or variable for which the bounds should be changed.
- [in] `lower` (*MSKint32t*) – If non-zero, then the lower bound is changed, otherwise the upper bound is changed.
- [in] `finite` (*MSKint32t*) – If non-zero, then `value` is assumed to be finite.
- [in] `value` (*MSKrealt*) – New value for the bound.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putbound, *MSK_DPAR_DATA_TOL_BOUND_INF*, *MSK_DPAR_DATA_TOL_BOUND_WRN*

`ret = MSK_chgconbound(task, i, lower, finite, value)`

Changes a bound for one constraint.

If `lower` is non-zero, then the lower bound is changed as follows:

$$\text{new lower bound} = \begin{cases} -\infty, & \text{finite} = 0, \\ \text{value} & \text{otherwise.} \end{cases}$$

Otherwise if `lower` is zero, then

$$\text{new upper bound} = \begin{cases} \infty, & \text{finite} = 0, \\ \text{value} & \text{otherwise.} \end{cases}$$

Please note that this function automatically updates the bound key for bound, in particular, if the lower and upper bounds are identical, the bound key is changed to **fixed**.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of the constraint for which the bounds should be changed.
- [in] `lower` (*MSKint32t*) – If non-zero, then the lower bound is changed, otherwise the upper bound is changed.
- [in] `finite` (*MSKint32t*) – If non-zero, then `value` is assumed to be finite.

- [in] `value` (*MSKreal_t*) – New value for the bound.

Return

- `ret` (*MSKrescode_e*) – The function response code.

See also

`task.putconbound`, `MSK_DPAR_DATA_TOL_BOUND_INF`, `MSK_DPAR_DATA_TOL_BOUND_WRN`

`ret = MSK_chgvarbound(task, j, lower, finite, value)`

Changes a bound for on variable.

If `lower` is non-zero, then the lower bound is changed as follows:

$$\text{new lower bound} = \begin{cases} -\infty, & \text{finite} = 0, \\ \text{value} & \text{otherwise.} \end{cases}$$

Otherwise if `lower` is zero, then

$$\text{new upper bound} = \begin{cases} \infty, & \text{finite} = 0, \\ \text{value} & \text{otherwise.} \end{cases}$$

Please note that this function automatically updates the bound key for bound, in particular, if the lower and upper bounds are identical, the bound key is changed to **fixed**.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `j` (*MSKint32_t*) – Index of the variable for which the bounds should be changed.
- [in] `lower` (*MSKint32_t*) – If non-zero, then the lower bound is changed, otherwise the upper bound is changed.
- [in] `finite` (*MSKint32_t*) – If non-zero, then `value` is assumed to be finite.
- [in] `value` (*MSKreal_t*) – New value for the bound.

Return

- `ret` (*MSKrescode_e*) – The function response code.

See also

`task.putvarbound`, `MSK_DPAR_DATA_TOL_BOUND_INF`, `MSK_DPAR_DATA_TOL_BOUND_WRN`

`ret = MSK_clonetask(task, clonedtask)`

Creates a clone of an existing task copying all problem data and parameter settings to a new task.

Call-back functions are not copied, so a task containing nonlinear functions cannot be cloned.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `clonedtask` (*MSKtask_t*) – The cloned task.

Return

- `ret` (*MSKrescode_e*) – The function response code.

`ret = MSK_committchanges(task)`

Commits all cached problem changes to the task. It is usually not necessary explicitly to call this function since changes will be committed automatically when required.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.

Return

- `ret` (*MSKrescode_e*) – The function response code.

`ret = MSK_computesparsecholesky(env, multithread, ordermethod, tolsingular, n, anzc, aptrc, asubc, avalc, perm, diag, lnzc, lptrc, lensubnval, lsubc, lvalc)`

The function computes a Cholesky factorization of a sparse positive semidefinite matrix. Sparsity is exploited during the computations to reduce the amount of space and work required.

To be precise then given a symmetric matrix $A \in \mathbb{R}^{n \times n}$ the function computes a nonsingular lower triangular matrix L and diagonal matrix D such that

$$LL^T - D = PAP^T$$

where P is a permutation matrix. If a pivot during the computation of the Cholesky factorization is less than

$$-\rho * \max((PAP^T)_{jj}, 1.0)$$

then the matrix is declared negative semidefinite. On the hand if a pivot is smaller than

$$\rho * \max((PAP^T)_{jj}, 1.0),$$

then D_{jj} is increased from zero to

$$\rho * \max((PAP^T)_{jj}, 1.0).$$

Therefore, if A is sufficiently positive definite then D will be the zero matrix. ρ is set equal to value of `tolsingular`.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `multithread` (*MSKint32t*) – If nonzero then the function may exploit multiple threads.
- [in] `ordermethod` (*MSKint32t*) – If nonzero, then a sparsity preserving ordering will be employed.
- [in] `tolsingular` (*MSKrealt*) – A positive parameter controlling when a pivot is declared zero.
- [in] `n` (*MSKint32t*) – Specifies the order of A .
- [in] `anzc` (*MSKint32t*) – `anzc[j]` is the number of nonzeros in the j th column of A .
- [in] `aptrc` (*MSKint64t*) – `aptrc[j]` is a pointer to the first element in column j .
- [in] `asubc` (*MSKint32t*) – Row subscripts in each column stored in increasing order.
- [in] `avalc` (*MSKrealt*) – Values stores column wise.
- [out] `perm` (*MSKint32t*) – Is permutation array used to specify the permutation matrix P computed by the function.
- [out] `diag` (*MSKrealt*) – The diagonal elements of matrix D .
- [out] `lnzc` (*MSKint32t*) – `lnzc[j]` is the number of non zero elements in column j .
- [out] `lptrc` (*MSKint64t*) – `lptrc[j]` is a pointer to the first row index and value in column j .
- [out] `lensubnval` (*MSKint64t*) – Number of elements in `lsubc` and `lvalc`.
- [out] `lsubc` (*MSKint32t*) – Row indexes for each column stored sequentially. Must be stored increasing order for each column.
- [out] `lvalc` (*MSKrealt*) – The value corresponding to row indexed stored `lsubc`.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`env.sparsetriangularsolvedense`

`ret = MSK_conetypetostr(task, ct, str)`

Obtains the cone string identifier corresponding to a cone type.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.

- [in] `ct` (*MSKconetypee*) – Specifies the type of the cone.
- [out] `str` (*MSKstring_t*) – String corresponding to the cone type code `ct`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_deleteenv(env)`

Deletes a **MOSEK** environment and all the data associated with it.

Before calling this function it is a good idea to call the function `env.unlinkfuncfromenvstream` for each stream that has have had function linked to it.

Parameters

- [io] `env` (*MSKenv_t*) – The **MOSEK** environment.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_deletesolution(task, whichsol)`

Undefine a solution and frees the memory it uses.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_deletetask(task)`

Deletes a task.

Parameters

- [io] `task` (*MSKtask_t*) – An optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_dot(env, n, x, y, xty)`

Computes the inner product of two vectors x, y of length $n \geq 0$, i.e

$$x \cdot y = \sum_{i=1}^n x_i y_i.$$

Note that if $n = 0$, then the results of the operation is 0.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `n` (*MSKint32t*) – Length of the vectors.
- [in] `x` (*MSKrealt*) – The x vector.
- [in] `y` (*MSKrealt*) – The y vector.
- [out] `xty` (*MSKrealt*) – The result of the inner product between x and y .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_dualsensitivity(task, numj, subj, leftpricej, rightpricej, leftrangej, rightrangej)`

Calculates sensitivity information for objective coefficients. The indexes of the coefficients to analyze are

$$\{\text{subj}[i] | i \in 0, \dots, \text{numj} - 1\}$$

The results are returned so that e.g `leftprice[j]` is the left shadow price of the objective coefficient with index `subj[j]`.

The type of sensitivity analysis to perform (basis or optimal partition) is controlled by the parameter `MSK_IPAR_SENSITIVITY_TYPE`.

For an example, please see Section 15.1.4.

Parameters

- [in] `task` (`MSKtask_t`) – An optimization task.
- [in] `numj` (`MSKint32t`) – Number of coefficients to be analyzed. Length of `subj`.
- [in] `subj` (`MSKint32t`) – Index of objective coefficients to analyze.
- [out] `leftpricej` (`MSKrealt`) – `leftpricej[j]` is the left shadow price for the coefficients with index `subj[j]`.
- [out] `rightpricej` (`MSKrealt`) – `rightpricej[j]` is the right shadow price for the coefficients with index `subj[j]`.
- [out] `leftrangej` (`MSKrealt`) – `leftrangej[j]` is the left range β_1 for the coefficient with index `subj[j]`.
- [out] `rightrangej` (`MSKrealt`) – `rightrangej[j]` is the right range β_2 for the coefficient with index `subj[j]`.

Return

- `ret` (`MSKrescodee`) – The function response code.

See also

`task.primalsensitivity`, `task.sensitivityreport`, `MSK_IPAR_SENSITIVITY_TYPE`,
`MSK_IPAR_LOG_SENSITIVITY`, `MSK_IPAR_LOG_SENSITIVITY_OPT`

`ret = MSK_echoenv(env, whichstream, format, varnumarg)`

Sends a message to a given environment stream.

Parameters

- [in] `env` (`MSKenv_t`) – The **MOSEK** environment.
- [in] `whichstream` (`MSKstreamtypee`) – Index of the stream.
- [in] `format` (`MSKstring_t`) – Is a valid C format string which matches the arguments in
....
- [in] `varnumarg` (`vararg`) – A variable argument list.

Return

- `ret` (`MSKrescodee`) – The function response code.

`ret = MSK_echointro(env, longver)`

Prints an intro to message stream.

Parameters

- [in] `env` (`MSKenv_t`) – The **MOSEK** environment.
- [in] `longver` (`MSKint32t`) – If non-zero, then the intro is slightly longer.

Return

- `ret` (`MSKrescodee`) – The function response code.

`ret = MSK_echotask(task, whichstream, format, varnumarg)`

Prints a format string to a task stream.

Parameters

- [in] `task` (`MSKtask_t`) – An optimization task.
- [in] `whichstream` (`MSKstreamtypee`) – Index of the stream.
- [in] `format` (`MSKstring_t`) – A formatting string.
- [in] `varnumarg` (`vararg`) – Additional arguments

Return

- `ret` (`MSKrescodee`) – The function response code.

`ret = MSK_freedbgenv(env, buffer, file, line)`

Frees space allocated by a **MOSEK** function. Must not be applied to the **MOSEK** environment and task.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [io] `buffer` (*void**) – A pointer.
- [in] `file` (*MSKstring_t*) – File from which the function is called.
- [in] `line` (*unsigned*) – Line in the file from which the function is called.

`ret = MSK_freedbgtask(task, buffer, file, line)`

Frees space allocated by a **MOSEK** function. Must not be applied to the **MOSEK** environment and task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [io] `buffer` (*void**) – A pointer.
- [in] `file` (*MSKstring_t*) – File from which the function is called.
- [in] `line` (*unsigned*) – Line in the file from which the function is called.

`ret = MSK_freeenv(env, buffer)`

Frees space allocated by a **MOSEK** function. Must not be applied to the **MOSEK** environment and task.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [io] `buffer` (*void**) – A pointer.

`ret = MSK_freetask(task, buffer)`

Frees space allocated by a **MOSEK** function. Must not be applied to the **MOSEK** environment and task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [io] `buffer` (*void**) – A pointer.

`ret = MSK_gemm(env, transa, transb, m, n, k, alpha, a, b, beta, c)`

Performs a matrix multiplication plus addition of dense matrices. Given A , B and C of compatible dimensions, this function computes

$$C := \alpha op(A) op(B) + \beta C$$

where α, β are two scalar values. The function $op(X)$ return X if `transX` is YES, or X^T if set to NO. Dimensions of A, b must therefore match those of C .

The result of this operation is stored in C .

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `transa` (*MSKtransposee*) – Indicates whether the matrix A must be transposed.
- [in] `transb` (*MSKtransposee*) – Indicates whether the matrix B must be transposed.
- [in] `m` (*MSKint32t*) – Indicates the number of rows of matrices A and C .
- [in] `n` (*MSKint32t*) – Indicates the number of columns of matrices B and C .
- [in] `k` (*MSKint32t*) – Specifies the number of columns of the matrix A and the number of rows of the matrix B .
- [in] `alpha` (*MSKreal_t*) – A scalar value multiplying the result of the matrix multiplication.

- [in] a (*MSKrealt*) – The pointer to the array storing matrix A in a column-major format.
- [in] b (*MSKrealt*) – Indicates the number of rows of matrix B and columns of matrix A .
- [in] beta (*MSKrealt*) – A scalar value that multiplies C .
- [io] c (*MSKrealt*) – The pointer to the array storing matrix C in a column-major format.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_gemv(env, transa, m, n, alpha, a, x, beta, y)

Computes the multiplication of a scaled dense matrix times a dense vector product, plus a scaled dense vector. In formula

$$y = \alpha Ax + \beta y,$$

or if trans is set to transpose.yes

$$y = \alpha A^T x + \beta y,$$

where α, β are scalar values. A is an $n \times m$ matrix, $x \in \mathbb{R}^m$ and $y \in \mathbb{R}^n$.

Note that the result is stored overwriting y .

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] transa (*MSKtransposee*) – Indicates whether the matrix A must be transposed.
- [in] m (*MSKint32t*) – Specifies the number of rows of the matrix A .
- [in] n (*MSKint32t*) – Specifies the number of columns of the matrix A .
- [in] alpha (*MSKrealt*) – A scalar value multiplying the matrix A .
- [in] a (*MSKrealt*) – A pointer to the array storing matrix A in a column-major format.
- [in] x (*MSKrealt*) – A pointer to the array storing the vector x .
- [in] beta (*MSKrealt*) – A scalar value multiplying the vector y .
- [io] y (*MSKrealt*) – A pointer to the array storing the vector y .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getacol(task, j, nzj, subj, valj)

Obtains one column of A in a sparse format.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] j (*MSKint32t*) – Index of the column.
- [out] nzj (*MSKint32t*) – Number of non-zeros in the column obtained.
- [out] subj (*MSKint32t*) – Index of the non-zeros in the row obtained.
- [out] valj (*MSKrealt*) – Numerical values of the column obtained.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getacolnumnz(task, i, nzj)

Obtains the number of non-zero elements in one column of A .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index of the column.

- [out] `nzj` (*MSKint32t*) – Number of non-zeros in the j th row or column of A .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getacolslicetrip(task, first, last, maxnumnz, surp, subi, subj, val)`

Obtains a sequence of columns from A in a sparse triplet format.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – Index of the first column in the sequence.
- [in] `last` (*MSKint32t*) – Index of the last column in the sequence **plus one**.
- [in] `maxnumnz` (*MSKint64t*) – Denotes the length of the arrays `subi`, `subj`, and `aval`.
- [io] `surp` (*MSKint64t*) – The required columns are stored sequentially in `subi` and `val` starting from position `maxnumnz-surp[0]`. On return `surp` has been decremented by the total number of non-zero elements in the columns obtained.
- [out] `subi` (*MSKint32t*) – Constraint subscripts.
- [out] `subj` (*MSKint32t*) – Column subscripts.
- [out] `val` (*MSKreal_t*) – Values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getaslicenumnz`

`ret = MSK_getapieceenumnz(task, firsti, lasti, firstj, lastj, numnz)`

Obtains the number non-zeros in a rectangular piece of A , i.e. the number

$$|(i, j) : a_{i,j} \neq 0, \text{firsti} \leq i \leq \text{lasti} - 1, \text{firstj} \leq j \leq \text{lastj} - 1|$$

where $|\mathcal{I}|$ means the number of elements in the set \mathcal{I} .

This function is not an efficient way to obtain the number of non-zeros in one row or column. In that case use the function `task.getarownumnz` or `task.getacolnumnz`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `firsti` (*MSKint32t*) – Index of the first row in the rectangular piece.
- [in] `lasti` (*MSKint32t*) – Index of the last row plus one in the rectangular piece.
- [in] `firstj` (*MSKint32t*) – Index of the first column in the rectangular piece.
- [in] `lastj` (*MSKint32t*) – Index of the last column plus one in the rectangular piece.
- [out] `numnz` (*MSKint32t*) – Number of non-zero A elements in the rectangular piece.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getaslicenumnz`

`ret = MSK_getarow(task, i, nzi, subi, vali)`

Obtains one row of A in a sparse format.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of the row or column.
- [out] `nzi` (*MSKint32t*) – Number of non-zeros in the row obtained.
- [out] `subi` (*MSKint32t*) – Index of the non-zeros in the row obtained.

- [out] `vali` (*MSKreal_t*) – Numerical values of the row obtained.

Return

- `ret` (*MSKrescode_e*) – The function response code.

`ret = MSK_getarownumnz(task, i, nzi)`

Obtains the number of non-zero elements in one row of A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32_t*) – Index of the row or column.
- [out] `nzi` (*MSKint32_t*) – Number of non-zeros in the i th row of A .

Return

- `ret` (*MSKrescode_e*) – The function response code.

`ret = MSK_getarowslicetrip(task, first, last, maxnumnz, surp, subi, subj, val)`

Obtains a sequence of rows from A in a sparse triplets format.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32_t*) – Index of the first row or column in the sequence.
- [in] `last` (*MSKint32_t*) – Index of the last row or column in the sequence **plus one**.
- [in] `maxnumnz` (*MSKint64_t*) – Denotes the length of the arrays `subi`, `subj`, and `aval`.
- [io] `surp` (*MSKint64_t*) – The required rows are stored sequentially in `subi` and `val` starting from position `maxnumnz-surp[0]`. On return `surp` has been decremented by the total number of non-zero elements in the rows obtained.
- [out] `subi` (*MSKint32_t*) – Constraint subscripts.
- [out] `subj` (*MSKint32_t*) – Column subscripts.
- [out] `val` (*MSKreal_t*) – Values.

Return

- `ret` (*MSKrescode_e*) – The function response code.

See also

`task.getaslicenumnz`

`ret = MSK_getaslice(task, accmode, first, last, maxnumnz, surp, ptrb, ptre, sub, val)`

Obtains a sequence of rows or columns from A in sparse format.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmode_e*) – Defines whether a column-slice or a row-slice is requested.
- [in] `first` (*MSKint32_t*) – Index of the first row or column in the sequence.
- [in] `last` (*MSKint32_t*) – Index of the last row or column in the sequence **plus one**.
- [in] `maxnumnz` (*MSKint32_t*) – Denotes the length of the arrays `sub` and `val`.
- [io] `surp` (*MSKint32_t*) – The required rows and columns are stored sequentially in `sub` and `val` starting from position `maxnumnz-surp[0]`. Upon return `surp` has been decremented by the total number of non-zero elements in the rows and columns obtained.
- [out] `ptrb` (*MSKint32_t*) – `ptrb[t]` is an index pointing to the first element in the t th row or column obtained.
- [out] `ptre` (*MSKint32_t*) – `ptre[t]` is an index pointing to the last element plus one in the t th row or column obtained.
- [out] `sub` (*MSKint32_t*) – Contains the row or column subscripts.
- [out] `val` (*MSKreal_t*) – Contains the coefficient values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getaslicenumnz`

```
ret = MSK_getaslice64(task, accmode, first, last, maxnumnz, surp, ptrb, ptre, sub, val)
```

Obtains a sequence of rows or columns from A in sparse format.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – Defines whether a column slice or a row slice is requested.
- [in] `first` (*MSKint32t*) – Index of the first row or column in the sequence.
- [in] `last` (*MSKint32t*) – Index of the last row or column in the sequence **plus one**.
- [in] `maxnumnz` (*MSKint64t*) – Denotes the length of the arrays `sub` and `val`.
- [io] `surp` (*MSKint64t*) – The required rows and columns are stored sequentially in `sub` and `val` starting from position `maxnumnz-surp[0]`. Upon return `surp` has been decremented by the total number of non-zero elements in the rows and columns obtained.
- [out] `ptrb` (*MSKint64t*) – `ptrb[t]` is an index pointing to the first element in the t th row or column obtained.
- [out] `ptre` (*MSKint64t*) – `ptre[t]` is an index pointing to the last element plus one in the t th row or column obtained.
- [out] `sub` (*MSKint32t*) – Contains the row or column subscripts.
- [out] `val` (*MSKrealt*) – Contains the coefficient values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getaslicenumnz64`

```
ret = MSK_getaslicenumnz(task, accmode, first, last, numnz)
```

Obtains the number of non-zeros in a row or column slice of A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – Defines whether non-zeros are counted in a column-slice or a row-slice.
- [in] `first` (*MSKint32t*) – Index of the first row or column in the sequence.
- [in] `last` (*MSKint32t*) – Index of the last row or column **plus one** in the sequence.
- [out] `numnz` (*MSKint32t*) – Number of non-zeros in the slice.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getaslicenumnz64(task, accmode, first, last, numnz)
```

Obtains the number of non-zeros in a slice of rows or columns of A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – Defines whether non-zeros are counted in a column slice or a row slice.
- [in] `first` (*MSKint32t*) – Index of the first row or column in the sequence.
- [in] `last` (*MSKint32t*) – Index of the last row or column **plus one** in the sequence.
- [out] `numnz` (*MSKint64t*) – Number of non-zeros in the slice.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getaij(task, i, j, aij)`

Obtains a single coefficient in A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Row index of the coefficient to be returned.
- [in] `j` (*MSKint32t*) – Column index of the coefficient to be returned.
- [out] `aij` (*MSKreal_t*) – The required coefficient $a_{i,j}$.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getbarablocktriplet(task, maxnum, num, subi, subj, subk, subl, valijkl)`

Obtains \bar{A} in block triplet form.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnum` (*MSKint64t*) – `subi`, `subj`, `subk`, `subl` and `valijkl` must be `maxnum` long.
- [out] `num` (*MSKint64t*) – Number of elements in the block triplet form.
- [out] `subi` (*MSKint32t*) – Constraint index.
- [out] `subj` (*MSKint32t*) – Symmetric matrix variable index.
- [out] `subk` (*MSKint32t*) – Block row index.
- [out] `subl` (*MSKint32t*) – Block column index.
- [out] `valijkl` (*MSKreal_t*) – A list indexes of the elements from symmetric matrix storage that appears in the weighted sum.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getbaraidx(task, idx, maxnum, i, j, num, sub, weights)`

Obtains information about an element in \bar{A} . Since \bar{A} is a sparse matrix of symmetric matrixes then only the nonzero elements in \bar{A} are stored in order to save space. Now \bar{A} is stored vectorized form i.e. as one long vector. This function makes it possible to obtain information such as the row index and the column index of a particular element of the vectorized form of \bar{A} .

Please observe if one element of \bar{A} is inputted multiple times then it may be stored several times in vectorized form. In that case the element with the highest index is the one that is used.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `idx` (*MSKint64t*) – Position of the element in the vectorized form.
- [in] `maxnum` (*MSKint64t*) – `sub` and `weights` must be at least `maxnum` long.
- [out] `i` (*MSKint32t*) – Row index of the element at position `idx`.
- [out] `j` (*MSKint32t*) – Column index of the element at position `idx`.
- [out] `num` (*MSKint64t*) – Number of terms in weighted sum that forms the element.
- [out] `sub` (*MSKint64t*) – A list indexes of the elements from symmetric matrix storage that appears in the weighted sum.
- [out] `weights` (*MSKreal_t*) – The weights associated with each term in the weighted sum.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getbaraidxij(task, idx, i, j)
```

Obtains information about an element in \bar{A} . Since \bar{A} is a sparse matrix of symmetric matrixes only the nonzero elements in \bar{A} are stored in order to save space. Now \bar{A} is stored vectorized form i.e. as one long vector. This function makes it possible to obtain information such as the row index and the column index of a particular element of the vectorized form of \bar{A} .

Please note that if one element of \bar{A} is inputted multiple times then it may be stored several times in vectorized form. In that case the element with the highest index is the one that is used.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] idx (*MSKint64t*) – Position of the element in the vectorized form.
- [out] i (*MSKint32t*) – Row index of the element at position idx.
- [out] j (*MSKint32t*) – Column index of the element at position idx.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getbaraidxinfo(task, idx, num)
```

Each nonzero element in \bar{A}_{ij} is formed as a weighted sum of symmetric matrices. Using this function the number terms in the weighted sum can be obtained. See description of *task.appendsparsesymmat* for details about the weighted sum.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] idx (*MSKint64t*) – The internal position of the element that should be obtained information for.
- [out] num (*MSKint64t*) – Number of terms in the weighted sum that forms the specified element in \bar{A} .

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getbarasparsity(task, maxnumnz, numnz, idxij)
```

The matrix \bar{A} is assumed to be a sparse matrix of symmetric matrixes. This implies that many of elements in \bar{A} is likely to be zero matrixes. Therefore, in order to save space only nonzero elements in \bar{A} are stored on vectorized form. This function is used to obtain the sparsity pattern of \bar{A} and the position of each nonzero element in the vectorized form of \bar{A} .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] maxnumnz (*MSKint64t*) – The arrays subi, subj, and idxij must be at least maxnumnz long.
- [out] numnz (*MSKint64t*) – Number of nonzero elements in \bar{A} .
- [out] idxij (*MSKint64t*) – Position of each nonzero element in the vectorized form of \bar{A}_{ij} . Hence, idxij[k] is the vector position of the element in row subi[k] and column subj[k] of \bar{A}_{ij} .

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getbarcblocktriplet(task, maxnum, num, subj, subk, subl, valijkl)
```

Obtains \bar{C} in block triplet form.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] maxnum (*MSKint64t*) – subj, subk, subl and valijkl must be maxnum long.
- [out] num (*MSKint64t*) – Number of elements in the block triplet form.

- [out] subj (*MSKint32t*) – Symmetric matrix variable index.
- [out] subk (*MSKint32t*) – Block row index.
- [out] subl (*MSKint32t*) – Block column index.
- [out] valijkl (*MSKrealt*) – A list indexes of the elements from symmetric matrix storage that appears in the weighted sum.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getbarcidx(task, idx, maxnum, j, num, sub, weights)

Obtains information about an element in \bar{c} .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] idx (*MSKint64t*) – Index of the element that should be obtained information about.
- [in] maxnum (*MSKint64t*) – sub and weights must be at least maxnum] long.
- [out] j (*MSKint32t*) – Row index in \bar{c} .
- [out] num (*MSKint64t*) – Number of terms in the weighted sum.
- [out] sub (*MSKint64t*) – Elements appearing the weighted sum.
- [out] weights (*MSKrealt*) – Weights of terms in the weighted sum.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getbarcidxinfo(task, idx, num)

Obtains information about the \bar{c}_{ij} .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] idx (*MSKint64t*) – Index of element that should be obtained information about. The value is an index of a symmetric sparse variable.
- [out] num (*MSKint64t*) – Number of terms that appears in weighted that forms the requested element.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getbarcidxj(task, idx, j)

Obtains the row index of an element in \bar{c} .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] idx (*MSKint64t*) – Index of the element that should be obtained information about.
- [out] j (*MSKint32t*) – Row index in \bar{c} .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getbarcsparsity(task, maxnumnz, numnz, idxj)

Internally only the nonzero elements of \bar{c} is stored

in a vector. This function returns which elements \bar{c} that are nonzero (in subj) and their internal position (in idx). Using the position detailed information about each nonzero \bar{C}_j can be obtained using *task.getbarcidxinfo* and *task.getbarcidx*.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] maxnumnz (*MSKint64t*) – idxj must be at least maxnumnz long.

- [out] numnz (*MSKint64t*) – Number of nonzero elements in \bar{C} .
- [out] idxj (*MSKint64t*) – Internal positions of the nonzeros elements in \bar{C} .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getbarsj(task, whichsol, j, barsj)

Obtains the dual solution for a semidefinite variable. Only the lower triangle part of \bar{s}_j is returned because the matrix by construction is symmetric. The format is that the columns are stored sequentially in the natural order.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] j (*MSKint32t*) – Index of the semidefinite variable.
- [out] barsj (*MSKrealt*) – Value of \bar{s}_j .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getbarvarname(task, i, maxlen, name)

Obtains a name of a semidefinite variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index.
- [in] maxlen (*MSKint32t*) – Length of the name buffer.
- [out] name (*MSKstring_t*) – The requested name is copied to this buffer.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getbarvarnamelen

ret = MSK_getbarvarnameindex(task, somename, asgn, index)

Obtains the index of name of semidefinite variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] somename (*MSKstring_t*) – The requested name is copied to this buffer.
- [out] asgn (*MSKint32t*) – Is non-zero if the name *somename* is assigned to a semidefinite variable.
- [out] index (*MSKint32t*) – If the name *somename* is assigned to a semidefinite variable, then *index* is the name of the constraint.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getbarvarname

ret = MSK_getbarvarnamelen(task, i, len)

Obtains the length of a name of a semidefinite variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index.
- [out] len (*MSKint32t*) – Returns the length of the indicated name.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`task.getbarvarname`

`ret = MSK_getbarxj(task, whichsol, j, barxj)`

Obtains the primal solution for a semidefinite variable. Only the lower triangle part of \bar{x}_j is returned because the matrix by construction is symmetric. The format is that the columns are stored sequentially in the natural order.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `whichsol (MSKsoltypee)` – Selects a solution.
- [in] `j (MSKint32t)` – Index of the semidefinite variable.
- [out] `barxj (MSKrealt)` – Value of \bar{X}_j .

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getbound(task, accmode, i, bk, bl, bu)`

Obtains bound information for one constraint or variable.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `accmode (MSKaccmodee)` – Defines if operations are performed row-wise (constraint-oriented) or column-wise (variable-oriented).
- [in] `i (MSKint32t)` – Index of the constraint or variable for which the bound information should be obtained.
- [out] `bk (MSKboundkeye)` – Bound keys.
- [out] `bl (MSKrealt)` – Values for lower bounds.
- [out] `bu (MSKrealt)` – Values for upper bounds.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getboundslice(task, accmode, first, last, bk, bl, bu)`

Obtains bounds information for a sequence of variables or constraints.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `accmode (MSKaccmodee)` – Defines if operations are performed row-wise (constraint-oriented) or column-wise (variable-oriented).
- [in] `first (MSKint32t)` – First index in the sequence.
- [in] `last (MSKint32t)` – Last index plus 1 in the sequence.
- [out] `bk (MSKboundkeye)` – Bound keys.
- [out] `bl (MSKrealt)` – Values for lower bounds.
- [out] `bu (MSKrealt)` – Values for upper bounds.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getbuildinfo(buildstate, builddate)`

Obtains build information.

Parameters

- [out] `buildstate (MSKstring_t)` – State of binaries, i.e. a debug, release candidate or final release.

- [out] `builddate (MSKstring_t)` – Date when the binaries were build.

Return

- ret (`MSKrescodee`) – The function response code.

`ret = MSK_getc(task, c)`

Obtains all objective coefficients *c*.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [out] `c (MSKrealt)` – Linear terms of the objective as a dense vector. The length is the number of variables.

Return

- ret (`MSKrescodee`) – The function response code.

`ret = MSK_getcj(task, j, cj)`

Obtains one coefficient of *c*.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `j (MSKint32t)` – Index of the variable for which *c* coefficient should be obtained.
- [out] `cj (MSKrealt)` – The value of *c_j*.

Return

- ret (`MSKrescodee`) – The function response code.

See also

`task.getcslice`

`ret = MSK_getcslice(task, first, last, c)`

Obtains a sequence of elements in *c*.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `first (MSKint32t)` – First index in the sequence.
- [in] `last (MSKint32t)` – Last index plus 1 in the sequence.
- [out] `c (MSKrealt)` – Linear terms of the objective as a dense vector. The length is the number of variables.

Return

- ret (`MSKrescodee`) – The function response code.

`ret = MSK_getcallbackfunc(task, func, handle)`

Obtains the current user-defined call-back function and associated *userhandle*.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [out] `func (callbackfunc)` – Get the user-defined progress call-back function `callbackfunc` associated with *task*. If *func* is identical to `|null|`, then no call-back function is associated with the *task*.
- [out] `handle (MSKuserhandle_t)` – The user-defined pointer associated with the user-defined call-back function.

Return

- ret (`MSKrescodee`) – The function response code.

`ret = MSK_getcfix(task, cfix)`

Obtains the fixed term in the objective.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.

- [out] `cfix` (*MSKrealt*) – Fixed term in the objective.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getcodedesc(code, symname, str)`

Obtains a short description of the meaning of the response code given by `code`.

Parameters

- [in] `code` (*MSKrescodee*) – A valid **MOSEK** response code.
- [out] `symname` (*MSKstring_t*) – Symbolic name corresponding to `code`.
- [out] `str` (*MSKstring_t*) – Obtains a short description of a response code.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getconbound(task, i, bk, bl, bu)`

Obtains bound information for one constraint.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of the constraint for which the bound information should be obtained.
- [out] `bk` (*MSKboundkeye*) – Bound keys.
- [out] `bl` (*MSKrealt*) – Values for lower bounds.
- [out] `bu` (*MSKrealt*) – Values for upper bounds.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getconboundslice(task, first, last, bk, bl, bu)`

Obtains bounds information for a slice of the constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `bk` (*MSKboundkeye*) – Bound keys.
- [out] `bl` (*MSKrealt*) – Values for lower bounds.
- [out] `bu` (*MSKrealt*) – Values for upper bounds.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getconname(task, i, maxlen, name)`

Obtains a name of a constraint.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index.
- [in] `maxlen` (*MSKint32t*) – Maximum length of name that can be stored in `name`.
- [out] `name` (*MSKstring_t*) – Is assigned the required name.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.getconnamelen

```
ret = MSK_getconnameindex(task, somename, asgn, index)
```

Checks whether the name `somename` has been assigned to any constraint. If it has been assigned to constraint, then index of the constraint is reported.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `somename` (*MSKstring_t*) – The name which should be checked.
- [out] `asgn` (*MSKint32t*) – Is non-zero if the name `somename` is assigned to a constraint.
- [out] `index` (*MSKint32t*) – If the name `somename` is assigned to a constraint, then `index` is the name of the constraint.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getconnamelen(task, i, len)
```

Obtains the length of a name of a constraint variable.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index.
- [out] `len` (*MSKint32t*) – Returns the length of the indicated name.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.getbarvarname

```
ret = MSK_getcone(task, k, ct, coneapar, nummem, submem)
```

Obtains a conic constraint.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `k` (*MSKint32t*) – Index of the cone constraint.
- [out] `ct` (*MSKconetypee*) – Specifies the type of the cone.
- [out] `coneapar` (*MSKrealt*) – This argument is currently not used. It can be set to 0
- [out] `nummem` (*MSKint32t*) – Number of member variables in the cone.
- [out] `submem` (*MSKint32t*) – Variable subscripts of the members in the cone.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getconeinfo(task, k, ct, coneapar, nummem)
```

Obtains information about a conic constraint.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `k` (*MSKint32t*) – Index of the conic constraint.
- [out] `ct` (*MSKconetypee*) – Specifies the type of the cone.
- [out] `coneapar` (*MSKrealt*) – This argument is currently not used. It can be set to 0
- [out] `nummem` (*MSKint32t*) – Number of member variables in the cone.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getconename(task, i, maxlen, name)
```

Obtains a name of a cone.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index.
- [in] maxlen (*MSKint32t*) – Maximum length of name that can be stored in name.
- [out] name (*MSKstring_t*) – Is assigned the required name.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getconnamelen

ret = MSK_getconenameindex(task, somename, asgn, index)

Checks whether the name somename has been assigned to any cone. If it has been assigned to cone, then index of the cone is reported.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] somename (*MSKstring_t*) – The name which should be checked.
- [out] asgn (*MSKint32t*) – Is non-zero if the name somename is assigned to a cone.
- [out] index (*MSKint32t*) – If the name somename is assigned to a cone, then index is the name of the cone.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getconenamelen(task, i, len)

Obtains the length of a name of a cone.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index.
- [out] len (*MSKint32t*) – Returns the length of the indicated name.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getbarvarname

ret = MSK_getdimbarvarj(task, j, dimbarvarj)

Obtains the dimension of a symmetric matrix variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] j (*MSKint32t*) – Index of the semidefinite variable whose dimension is requested.
- [out] dimbarvarj (*MSKint32t*) – The dimension of the j'th semidefinite variable.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getdouinf(task, whichdinf, dvalue)

Obtains a double information item from the task information database.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichdinf (*MSKdinfiteme*) – A double information item.
- [out] dvalue (*MSKreal_t*) – The value of the required double information item.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getdouparam(task, param, parvalue)
```

Obtains the value of a double parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] param (*MSKdparam*) – Which parameter.
- [out] parvalue (*MSKreal_t*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getdualobj(task, whichsol, dualobj)
```

Computes the dual objective value associated with the solution. Note if the solution is a primal infeasible solution.

Moreover, since there is no dual solution associated with integer solution, then an error will be reported if the dual objective value is requested for the integer solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [out] dualobj (*MSKreal_t*) – Objective value corresponding to the dual solution.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getdualsolutionnorms(task, whichsol, nrmy, nrmslc, nrmsuc, nrmslx, nrmsux,
                                nrmsnx, nrmbars)
```

Compute norms of the primal solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [out] nrmy (*MSKreal_t*) – The norm of the y vector.
- [out] nrmslc (*MSKreal_t*) – The norm of the slc vector.
- [out] nrmsuc (*MSKreal_t*) – The norm of the suc vector.
- [out] nrmslx (*MSKreal_t*) – The norm of the slx vector.
- [out] nrmsux (*MSKreal_t*) – The norm of the sux vector.
- [out] nrmsnx (*MSKreal_t*) – The norm of the snx vector.
- [out] nrmbars (*MSKreal_t*) – The norm of the bars vector.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getdviolbarvar(task, whichsol, num, sub, viol)
```

Let $(\bar{S}_j)^*$ be the value of variable \bar{S}_j for the specified solution. Then the dual violation of the solution associated with variable \bar{S}_j is given by

$$\max(-\lambda_{\min}(\bar{S}_j), 0.0).$$

Both when the solution is a certificate of primal infeasibility or when it is dual feasibility solution the violation should be small.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of \bar{X} variables.

•[out] viol (*MSKrealt*) – viol[k] is violation of the solution for the constraint $\bar{S}_{\text{sub}[k]} \in \mathcal{S}_+$.
Return

•ret (*MSKrescodee*) – The function response code.

ret = MSK_getdviolcon(task, whichsol, num, sub, viol)

The violation of the dual solution associated with the i 'th constraint is computed as follows

$$\max(\rho((s_l^c)_i^*, (b_l^c)_i), \rho((s_u^c)_i^*, -(b_u^c)_i), | -y_i + (s_l^c)_i^* - (s_u^c)_i^* |)$$

where

$$\rho(x, l) = \begin{cases} -x, & l > -\infty, \\ |x|, & \text{otherwise} \end{cases}$$

Both when the solution is a certificate of primal infeasibility or it is a dual feasibility solution the violation should be small.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of constraints.
- [out] viol (*MSKrealt*) – viol[k] is the violation of dual solution associated with the constraint sub[k].

Return

•ret (*MSKrescodee*) – The function response code.

ret = MSK_getdviolcones(task, whichsol, num, sub, viol)

Let $(s_n^x)^*$ be the value of variable (s_n^x) for the specified solution. For simplicity let us assume that s_n^x is a member of quadratic cone, then the violation is computed as follows

$$\begin{cases} \max(0, \|(s_n^x)_{2:n}^* - (s_n^x)_1^*\|/\sqrt{2}, & (s_n^x)^* \geq -\|(s_n^x)_{2:n}^*\|, \\ \|(s_n^x)^*\|, & \text{otherwise.} \end{cases}$$

Both when the solution is a certificate of primal infeasibility or when it is a dual feasibility solution the violation should be small.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of \bar{X} variables.
- [out] viol (*MSKrealt*) – viol[k] violation of the solution associated with sub[k]'th dual conic constraint.

Return

•ret (*MSKrescodee*) – The function response code.

ret = MSK_getdviolvar(task, whichsol, num, sub, viol)

The violation of the dual solution associated with the j 'th variable is computed as follows

$$\max \left(\rho((s_l^x)_i^*, (b_l^x)_i), \rho((s_u^x)_i^*, -(b_u^x)_i), \left| \sum_{j=0}^{\text{numcon}-1} a_{ij}y_i + (s_l^x)_i^* - (s_u^x)_i^* - \tau c_j \right| \right)$$

where

$$\rho(x, l) = \begin{cases} -x, & l > -\infty, \\ |x|, & \text{otherwise} \end{cases}$$

$\tau = 0$ if the solution is certificate of dual infeasibility and $\tau = 1$ otherwise. The formula for computing the violation is only shown for linear case but is generalized appropriately for the more general problems.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of x variables.
- [out] viol (*MSKrealt*) – viol[k] is the maximal violation of the solution for the constraints $(s_l^x)_{\text{sub}[k]} \geq 0$ and $(s_u^x)_{\text{sub}[k]} \geq 0$.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getenv(task, env)

Obtains the environment used to create the task.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] env (*MSKenv_t*) – The **MOSEK** environment.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getinfindex(task, inftype, infname, infindex)

Obtains the index of a named information item.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] inftype (*MSKinftypee*) – Type of the information item.
- [in] infname (*MSKstring_t*) – Name of the information item.
- [out] infindex (*MSKint32t*) – The item index.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getinfmax(task, inftype, infmax)

Obtains the maximum index of an information of a given type inftype plus 1.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] inftype (*MSKinftypee*) – Type of the information item.
- [out] infmax (*MSKint32t*) – The maximum index requested.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getinfname(task, inftype, whichinf, infname)

Obtains the name of an information item.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] inftype (*MSKinftypee*) – Type of the information item.
- [in] whichinf (*MSKint32t*) – An information item.
- [out] infname (*MSKstring_t*) – Name of the information item.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getinfeasiblesubproblem(task, whichsol, inftask)
```

Given the solution is a certificate of primal or dual infeasibility then a primal or dual infeasible subproblem is obtained respectively. The subproblem tend to be much smaller than the original problem and hence it easier to locate the infeasibility inspecting the subproblem than the original problem.

For the procedure to be useful then it is important to assigning meaningful names to constraints, variables etc. in the original task because those names will be duplicated in the subproblem.

The function is only applicable to linear and conic quadratic optimization problems.

For more information see Section 14.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Which solution to use when determining the infeasible subproblem.
- [out] inftask (*MSKtask_t*) – A new task containing the infeasible subproblem.

Return

- ret (*MSKrescodee*) – The function response code.

See also

MSK_IPAR_INFEAS_PREFER_PRIMAL

```
ret = MSK_getintinf(task, whichiinf, ivalue)
```

Obtains an integer information item from the task information database.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichiinf (*MSKiinfiteme*) – Specifies an information item.
- [out] ivalue (*MSKint32t*) – The value of the required integer information item.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getintparam(task, param, parvalue)
```

Obtains the value of an integer parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] param (*MSKiparam*) – Which parameter.
- [out] parvalue (*MSKint32t*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getlasterror(task, lastrescode, maxlen, lastmsglen, lastmsg)
```

Obtains the last response code and corresponding message reported in **MOSEK**.

If there is no previous error, warning or termination code for this task, *lastrescode* returns *MSK_RESPONSE_OK* and *lastmsg* returns an empty string, otherwise the last response code different from *MSK_RESPONSE_OK* and the corresponding message are returned.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] lastrescode (*MSKrescodee*) – Returns the last error code reported in the task.
- [in] maxlen (*MSKint32t*) – The length if the lastmsg buffer.
- [out] lastmsglen (*MSKint32t*) – Returns the length of the last error message reported in the task.
- [out] lastmsg (*MSKstring_t*) – Returns the last error message reported in the task.

Return

- **ret** (*MSKrescodee*) – The function response code.

ret = `MSK_getlasterror64(task, lastrescode, maxlen, lastmsglen, lastmsg)`

Obtains the last response code and corresponding message reported in **MOSEK**.

If there is no previous error, warning or termination code for this task, `lastrescode` returns *MSK_RESPONSE_OK* and `lastmsg` returns an empty string, otherwise the last response code different from *MSK_RESPONSE_OK* and the corresponding message are returned.

Parameters

- [in] **task** (*MSKtask_t*) – An optimization task.
- [out] **lastrescode** (*MSKrescodee*) – Returns the last error code reported in the task.
- [in] **maxlen** (*MSKint64t*) – The length if the `lastmsg` buffer.
- [out] **lastmsglen** (*MSKint64t*) – Returns the length of the last error message reported in the task.
- [out] **lastmsg** (*MSKstring_t*) – Returns the last error message reported in the task.

Return

- **ret** (*MSKrescodee*) – The function response code.

ret = `MSK_getlenbarvarj(task, j, lenbarvarj)`

Obtains the length of the *j*th semidefinite variable i.e. the number of elements in the triangular part.

Parameters

- [in] **task** (*MSKtask_t*) – An optimization task.
- [in] **j** (*MSKint32t*) – Index of the semidefinite variable whose length if requested.
- [out] **lenbarvarj** (*MSKint64t*) – Number of scalar elements in the lower triangular part of the semidefinite variable.

Return

- **ret** (*MSKrescodee*) – The function response code.

ret = `MSK_getlintinf(task, whichliinf, ivalue)`

Obtains an integer information item from the task information database.

Parameters

- [in] **task** (*MSKtask_t*) – An optimization task.
- [in] **whichliinf** (*MSKliinfiteme*) – Specifies an information item.
- [out] **ivalue** (*MSKint64t*) – The value of the required integer information item.

Return

- **ret** (*MSKrescodee*) – The function response code.

ret = `MSK_getmaxnamelen(task, maxlen)`

Obtains the maximum length (not including terminating zero character) of any objective, constraint, variable or cone name.

Parameters

- [in] **task** (*MSKtask_t*) – An optimization task.
- [out] **maxlen** (*MSKint32t*) – The maximum length of any name.

Return

- **ret** (*MSKrescodee*) – The function response code.

ret = `MSK_getmaxnumanz(task, maxnumanz)`

Obtains number of preallocated non-zeros in *A*. When this number of non-zeros is reached **MOSEK** will automatically allocate more space for *A*.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumanz (*MSKint32t*) – Number of preallocated non-zero elements in A .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getmaxnumanz64(task, maxnumanz)

Obtains number of preallocated non-zeros in A . When this number of non-zeros is reached **MOSEK** will automatically allocate more space for A .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumanz (*MSKint64t*) – Number of preallocated non-zero elements in A .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getmaxnumbarvar(task, maxnumbarvar)

Obtains maximum number of symmetric matrix variables that is reserved room for.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumbarvar (*MSKint32t*) – Maximum number of symmetric matrix variables currently that is reserved room for.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getmaxnumcon(task, maxnumcon)

Obtains the number of preallocated constraints in the optimization task. When this number of constraints is reached **MOSEK** will automatically allocate more space for constraints.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumcon (*MSKint32t*) – Number of preallocated constraints in the optimization task.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getmaxnumcone(task, maxnumcone)

Obtains the number of preallocated cones in the optimization task. When this number of cones is reached **MOSEK** will automatically allocate space for more cones.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumcone (*MSKint32t*) – Number of preallocated conic constraints in the optimization task.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getmaxnumqnz(task, maxnumqnz)

Obtains the number of preallocated non-zeros for Q (both objective and constraints). When this number of non-zeros is reached **MOSEK** will automatically allocate more space for Q .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumqnz (*MSKint32t*) – Number of non-zero elements preallocated in quadratic coefficient matrices.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getmaxnumqnz64(task, maxnumqnz)
```

Obtains the number of preallocated non-zeros for Q (both objective and constraints). When this number of non-zeros is reached **MOSEK** will automatically allocate more space for Q .

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumqnz (*MSKint64t*) – Number of non-zero elements preallocated in quadratic coefficient matrices.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getmaxnumvar(task, maxnumvar)
```

Obtains the number of preallocated variables in the optimization task. When this number of variables is reached **MOSEK** will automatically allocate more space for constraints.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] maxnumvar (*MSKint32t*) – Number of preallocated variables in the optimization task.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getmemusagetask(task, meminuse, maxmemuse)
```

Obtains information about the amount of memory used by a task.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [out] meminuse (*MSKint64t*) – Amount of memory currently used by the task.
- [out] maxmemuse (*MSKint64t*) – Maximum amount of memory used by the task until now.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getnadouinf(task, whichdinf, dvalue)
```

Obtains a double information item from task information database.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichdinf (*MSKstring_t*) – A double information item.
- [out] dvalue (*MSKrealt*) – The value of the required double information item.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getnadoupam(task, paramname, parvalue)
```

Obtains the value of a named double parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] paramname (*MSKstring_t*) – Name of a parameter.
- [out] parvalue (*MSKrealt*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getnaintinf(task, infitemname, ivalue)
```

Obtains an integer information item from the task information database.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] infitemname (*MSKstring_t*) – The name of the integer information.

- [out] ivalue (*MSKint32t*) – The value of the required integer information item.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getnaintparam(task, paramname, parvalue)

Obtains the value of a named integer parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] paramname (*MSKstring_t*) – Name of a parameter.
- [out] parvalue (*MSKint32t*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getnastrparam(task, paramname, maxlen, len, parvalue)

Obtains the value of a named string parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] paramname (*MSKstring_t*) – Name of a parameter.
- [in] maxlen (*MSKint32t*) – Length of parvalue.
- [out] len (*MSKint32t*) – Identical to length of string hold by parvalue.
- [out] parvalue (*MSKstring_t*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getnastrparamal(task, paramname, numaddchr, value)

Obtains the value of a string parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] paramname (*MSKstring_t*) – Name of a parameter.
- [in] numaddchr (*MSKint32t*) – Number of additional characters that is made room for in value[\idxbeg].
- [io] value (*MSKstring_t*) – Is the value corresponding to string parameter param. value[\idxbeg] is char buffer allocated **MOSEK** and it must be freed by *task.freetask*.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getnlfunc(task, nlhandle, nlgetsp, nlgetva)

This function is used to retrieve the nonlinear call-back functions. If NULL no nonlinear call-back function exists.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [io] nlhandle (*MSKuserhandle_t*) – Retrieve the pointer to the user-defined data structure. This structure is passed to the functions *nlgetsp* and *nlgetva* whenever those two functions called.
- [out] nlgetsp (*nlgetspfunc*) – Retrieve the function which provide information about the structure of the nonlinear functions in the optimization problem.
- [out] nlgetva (*nlgetvafunc*) – Retrieve the function which is used to evaluate the nonlinear function in the optimization problem at a given point.

Return

- ret (*MSKrescodee*) – The function response code.

`ret = MSK_getnumanz(task, numanz)`

Obtains the number of non-zeros in A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numanz` (*MSKint32t*) – Number of non-zero elements in A .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumanz64(task, numanz)`

Obtains the number of non-zeros in A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numanz` (*MSKint64t*) – Number of non-zero elements in A .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumbarablocktriplets(task, num)`

Obtains an upper bound on the number of elements in the block triplet form of \bar{A} .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `num` (*MSKint64t*) – Number elements in the block triplet form of \bar{A} .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumbaranz(task, nz)`

Get the number of nonzero elements in \bar{A} .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `nz` (*MSKint64t*) – The number of nonzero elements in \bar{A} i.e. the number of \bar{a}_{ij} elements that is nonzero.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumbarcbblocktriplets(task, num)`

Obtains an upper bound on the number of elements in the block triplet form of \bar{C} .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `num` (*MSKint64t*) – An upper bound on the number elements in the block triplet form of \bar{C} .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumbarcnz(task, nz)`

Obtains the number of nonzero elements in \bar{C} .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `nz` (*MSKint64t*) – The number of nonzeros in \bar{C} i.e. the number of elements \bar{c}_j that is different from 0.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumbarvar(task, numbarvar)`

Obtains the number of semidefinite variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numbarvar` (*MSKint32t*) – Number of semidefinite variable in the problem.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumcon(task, numcon)`

Obtains the number of constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numcon` (*MSKint32t*) – Number of constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumcone(task, numcone)`

Obtains the number of cones.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numcone` (*MSKint32t*) – Number conic constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumconemem(task, k, nummem)`

Obtains the number of members in a cone.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `k` (*MSKint32t*) – Index of the cone.
- [out] `nummem` (*MSKint32t*) – Number of member variables in the cone.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumintvar(task, numintvar)`

Obtains the number of integer-constrained variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numintvar` (*MSKint32t*) – Number of integer variables.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumparam(task, partype, numparam)`

Obtains the number of parameters of a given type.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `partype` (*MSKparametertypee*) – Parameter type.
- [out] `numparam` (*MSKint32t*) – Identical to the number of parameters of the type `partype`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumqconknz(task, k, numqcnz)`

Obtains the number of non-zero quadratic terms in a constraint.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `k` (*MSKint32t*) – Index of the constraint for which the number of non-zero quadratic terms should be obtained.
- [out] `numqcnz` (*MSKint32t*) – Number of quadratic terms.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumqconknz64(task, k, numqcnz)`

Obtains the number of non-zero quadratic terms in a constraint.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `k` (*MSKint32t*) – Index of the constraint for which the number quadratic terms should be obtained.
- [out] `numqcnz` (*MSKint64t*) – Number of quadratic terms.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumqobjnz(task, numqonz)`

Obtains the number of non-zero quadratic terms in the objective.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numqonz` (*MSKint32t*) – Number of non-zero elements in Q^o .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumqobjnz64(task, numqonz)`

Obtains the number of non-zero quadratic terms in the objective.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numqonz` (*MSKint64t*) – Number of non-zero elements in Q^o .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumsymmat(task, num)`

Get the number of symmetric matrixes stored in the vector E .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `num` (*MSKint64t*) – Returns the number of symmetric sparse matrixes.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getnumvar(task, numvar)`

Obtains the number of variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `numvar` (*MSKint32t*) – Number of variables.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getobjname(task, maxlen, objname)`

Obtains the name assigned to the objective function.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxlen` (*MSKint32t*) – Length of `objname`.
- [out] `objname` (*MSKstring_t*) – Assigned the objective name.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getobjnamelen(task, len)`

Obtains the length of the name assigned to the objective function.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `len` (*MSKint32t*) – Assigned the length of the objective name.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getobjsense(task, sense)`

Gets the objective sense of the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `sense` (*MSKobjsensee*) – The returned objective sense.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putobjsense

`ret = MSK_getparammax(task, partype, parammax)`

Obtains the maximum index of a parameter of a given type plus 1.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `partype` (*MSKparametertypee*) – Parameter type.
- [out] `parammax` (*MSKint32t*) – The maximum index of the given parameter type.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getparamname(task, partype, param, parname)`

Obtains the name for a parameter `param` of type `partype`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `partype` (*MSKparametertypee*) – Parameter type.
- [in] `param` (*MSKint32t*) – Which parameter.
- [out] `parname` (*MSKstring_t*) – Parameter name.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getprimalobj(task, whichsol, primalobj)`

Computes the primal objective value for the desired solution. Note if the solution is an infeasibility certificate, then the fixed term in the objective is not included.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.

•[in] `whichsol` (*MSKsoltypee*) – Selects a solution.
 •[out] `primalobj` (*MSKrealt*) – Objective value corresponding to the primal solution.
 Return
 •ret (*MSKrescodee*) – The function response code.
`ret = MSK_getprimalsolutionnorms(task, whichsol, nrmxc, nrmxx, nrmbarx)`
 Compute norms of the primal solution.
 Parameters
 •[in] `task` (*MSKtask_t*) – An optimization task.
 •[in] `whichsol` (*MSKsoltypee*) – Selects a solution.
 •[out] `nrmxc` (*MSKrealt*) – The norm of xc vector.
 •[out] `nrmxx` (*MSKrealt*) – The norm of xx vector.
 •[out] `nrmbarx` (*MSKrealt*) – The norm of barx vector.
 Return
 •ret (*MSKrescodee*) – The function response code.
`ret = MSK_getprosta(task, whichsol, prosta)`
 Obtains the problem status.
 Parameters
 •[in] `task` (*MSKtask_t*) – An optimization task.
 •[in] `whichsol` (*MSKsoltypee*) – Selects a solution.
 •[out] `prosta` (*MSKprostae*) – Problem status.
 Return
 •ret (*MSKrescodee*) – The function response code.
`ret = MSK_getprobtype(task, probtype)`
 Obtains the problem type.
 Parameters
 •[in] `task` (*MSKtask_t*) – An optimization task.
 •[out] `probtype` (*MSKproblemttypee*) – The problem type.
 Return
 •ret (*MSKrescodee*) – The function response code.
`ret = MSK_getpviolbarvar(task, whichsol, num, sub, viol)`
 Let $(\bar{X}_j)^*$ be the value of variable \bar{X}_j for the specified solution. Then the primal violation of the solution associated with variable \bar{X}_j is given by

$$\max(-\lambda_{\min}(\bar{X}_j), 0.0).$$
 Parameters
 •[in] `task` (*MSKtask_t*) – An optimization task.
 •[in] `whichsol` (*MSKsoltypee*) – Selects a solution.
 •[in] `num` (*MSKint32t*) – Length of sub and viol.
 •[in] `sub` (*MSKint32t*) – An array of indexes of \bar{X} variables.
 •[out] `viol` (*MSKrealt*) – `viol[k]` is how much the solution violate the constraint $\bar{X}_{\text{sub}[k]} \in \mathcal{S}_+$.
 Return
 •ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getpviolcon(task, whichsol, num, sub, viol)
```

The primal violation of the solution associated of constraint is computed by

$$\max(l_i^c \tau - (x_i^c)^*, (x_i^c)^* \tau - u_i^c \tau, \left| \sum_{j=0}^{numvar-1} a_{ij} x_j^* - x_i^c \right|)$$

where τ is defined as follows. If the solution is a certificate of dual infeasibility, then $\tau = 0$ and otherwise $\tau = 1$. Both when the solution is a valid certificate of dual infeasibility or when it is primal feasibility solution the violation should be small. The above is only shown for linear case but is appropriately generalized for the other cases.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of constraints.
- [out] viol (*MSKrealt*) – viol[k] associated with the solution for the sub[k]’th constraint.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getpviolcones(task, whichsol, num, sub, viol)
```

Let x^* be the value of variable x for the specified solution. For simplicity let us assume that x is a member of quadratic cone, then the violation is computed as follows

$$\begin{cases} \max(0, \|x_{2:n}\| - x_1)/\sqrt{2}, & x_1 \geq -\|x_{2:n}\|, \\ \|x\|, & \text{otherwise.} \end{cases}$$

Both when the solution is a certificate of dual infeasibility or when it is a primal feasibility solution the violation should be small.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of \bar{X} variables.
- [out] viol (*MSKrealt*) – viol[k] violation of the solution associated with sub[k]’th conic constraint.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getpviolvar(task, whichsol, num, sub, viol)
```

Let x_j^* be the value of variable x_j for the specified solution. Then the primal violation of the solution associated with variable x_j is given by

$$\max(l_j^x \tau - x_j^*, x_j^* - u_j^x \tau).$$

where τ is defined as follows. If the solution is a certificate of dual infeasibility, then $\tau = 0$ and otherwise $\tau = 1$. Both when the solution is a valid certificate of dual infeasibility or when it is primal feasibility solution the violation should be small.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] num (*MSKint32t*) – Length of sub and viol.
- [in] sub (*MSKint32t*) – An array of indexes of x variables.

- [out] `viol (MSKreal_t)` – `viol[k]` is the violation associated the solution for variable x_j .

Return

- `ret (MSKrescode_e)` – The function response code.

`ret = MSK_getqconk(task, k, maxnumqcnz, qcsurp, numqcnz, qcsubi, qcsubj, qcval)`

Obtains all the quadratic terms in a constraint. The quadratic terms are stored sequentially `qcsubi`, `qcsubj`, and `qcval`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `k (MSKint32_t)` – Which constraint.
- [in] `maxnumqcnz (MSKint32_t)` – Length of the arrays `qcsubi`, `qcsubj`, and `qcval`.
- [io] `qcsurp (MSKint32_t)` – When entering the function it is assumed that the last `qcsurp[0]` positions in `qcsubi`, `qcsubj`, and `qcval` are free. Hence, the quadratic terms are stored in this area, and upon return `qcsurp` is number of free positions left in `qcsubi`, `qcsubj`, and `qcval`.
- [out] `numqcnz (MSKint32_t)` – Number of quadratic terms.
- [out] `qcsubi (MSKint32_t)` – i subscripts for q_{ij}^k .
- [out] `qcsubj (MSKint32_t)` – j subscripts for q_{ij}^k .
- [out] `qcval (MSKreal_t)` – Numerical value for q_{ij}^k .

Return

- `ret (MSKrescode_e)` – The function response code.

`ret = MSK_getqconk64(task, k, maxnumqcnz, qcsurp, numqcnz, qcsubi, qcsubj, qcval)`

Obtains all the quadratic terms in a constraint. The quadratic terms are stored sequentially `qcsubi`, `qcsubj`, and `qcval`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `k (MSKint32_t)` – Which constraint.
- [in] `maxnumqcnz (MSKint64_t)` – Length of the arrays `qcsubi`, `qcsubj`, and `qcval`.
- [io] `qcsurp (MSKint64_t)` – When entering the function it is assumed that the last `qcsurp[0]` positions in `qcsubi`, `qcsubj`, and `qcval` are free. Hence, the quadratic terms are stored in this area, and upon return `qcsurp` is number of free positions left in `qcsubi`, `qcsubj`, and `qcval`.
- [out] `numqcnz (MSKint64_t)` – Number of quadratic terms.
- [out] `qcsubi (MSKint32_t)` – i subscripts for q_{ij}^k .
- [out] `qcsubj (MSKint32_t)` – j subscripts for q_{ij}^k .
- [out] `qcval (MSKreal_t)` – Numerical value for q_{ij}^k .

Return

- `ret (MSKrescode_e)` – The function response code.

`ret = MSK_getqobj(task, maxnumqonz, qosurp, numqonz, qosubi, qosubj, qoval)`

Obtains the quadratic terms in the objective. The required quadratic terms are stored sequentially in `qosubi`, `qosubj`, and `qoval`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `maxnumqonz (MSKint32_t)` – The length of the arrays `qosubi`, `qosubj`, and `qoval`.

- [io] `qosurp` (*MSKint32t*) – When entering the function `qosurp`[0] is the number of free positions at the end of the arrays `qosubi`, `qosubj`, and `qoval`, and upon return `qosurp` is the updated number of free positions left in those arrays.
- [out] `numqonz` (*MSKint32t*) – Number of non-zero elements in Q^o .
- [out] `qosubi` (*MSKint32t*) – i subscript for q_{ij}^o .
- [out] `qosubj` (*MSKint32t*) – j subscript for q_{ij}^o .
- [out] `qoval` (*MSKreal t*) – Numerical value for q_{ij}^o .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getqobj64(task, maxnumqonz, qosurp, numqonz, qosubi, qosubj, qoval)`

Obtains the quadratic terms in the objective. The required quadratic terms are stored sequentially in `qosubi`, `qosubj`, and `qoval`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumqonz` (*MSKint64t*) – The length of the arrays `qosubi`, `qosubj`, and `qoval`.
- [io] `qosurp` (*MSKint64t*) – When entering the function `qosurp`[0] is the number of free positions at the end of the arrays `qosubi`, `qosubj`, and `qoval`, and upon return `qosurp` is the updated number of free positions left in those arrays.
- [out] `numqonz` (*MSKint64t*) – Number of non-zero elements in Q^o .
- [out] `qosubi` (*MSKint32t*) – i subscript for q_{ij}^o .
- [out] `qosubj` (*MSKint32t*) – j subscript for q_{ij}^o .
- [out] `qoval` (*MSKreal t*) – Numerical value for q_{ij}^o .

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getnumqobjnz64`

`ret = MSK_getqobjij(task, i, j, qoij)`

Obtains one coefficient q_{ij}^o in the quadratic term of the objective.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Row index of the coefficient.
- [in] `j` (*MSKint32t*) – Column index of coefficient.
- [out] `qoij` (*MSKreal t*) – The required coefficient.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getreducedcosts(task, whichsol, first, last, redcosts)`

Computes the reduced costs for a sequence of variables and return them in the variable `redcosts` i.e.

$$\text{redcosts}[j - \text{first}] = (s_l^x)_j - (s_u^x)_j, \quad j = \text{first}, \dots, \text{last} - 1 \quad (16.2)$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – See formula (16.2) for the definition.
- [in] `last` (*MSKint32t*) – See formula (16.2) for the definition.

- [out] `redcosts` (*MSKrealt*) – The reduced costs in the required sequence of variables are stored sequentially in `redcosts` starting at `redcosts[\idxbeg]`.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getresponseclass(r, rc)
```

Obtain the class of a response code.

Parameters

- [in] `r` (*MSKrescodee*) – A response code indicating the result of function call.
- [out] `rc` (*MSKrescodetypee*) – The return response class

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_getskc(task, whichsol, skc)
```

Obtains the status keys for the constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `skc` (*MSKstakeye*) – Status keys for the constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

[*task.getskcslice*](#)

```
ret = MSK_getskcslice(task, whichsol, first, last, skc)
```

Obtains the status keys for the constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `skc` (*MSKstakeye*) – Status keys for the constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

[*task.getskc*](#)

```
ret = MSK_getskx(task, whichsol, skx)
```

Obtains the status keys for the scalar variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `skx` (*MSKstakeye*) – Status keys for the variables.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

[*task.getskxslice*](#)

```
ret = MSK_getskxslice(task, whichsol, first, last, skx)
```

Obtains the status keys for the variables.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] skx (*MSKstakeye*) – Status keys for the variables.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getslc(task, whichsol, slc)

Obtains the s_l^c vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [out] slc (*MSKrealt*) – The s_l^c vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getslcslice

ret = MSK_getslcslice(task, whichsol, first, last, slc)

Obtains a slice of the s_l^c vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] slc (*MSKrealt*) – Dual variables corresponding to the lower bounds on the constraints (s_l^c).

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getslc

ret = MSK_getslx(task, whichsol, slx)

Obtains the s_l^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [out] slx (*MSKrealt*) – The s_l^x vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getslx

ret = MSK_getslxslice(task, whichsol, first, last, slx)

Obtains a slice of the s_l^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.

- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] slx (*MSKreal t*) – Dual variables corresponding to the lower bounds on the variables (s_l^x).

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getslx

ret = MSK_getsnx(task, whichsol, snx)

Obtains the s_n^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [out] snx (*MSKreal t*) – The s_n^x vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getsnxslice

ret = MSK_getsnxslice(task, whichsol, first, last, snx)

Obtains a slice of the s_n^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] snx (*MSKreal t*) – Dual variables corresponding to the conic constraints on the variables (s_n^x).

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getsnx

ret = MSK_getsolsta(task, whichsol, solsta)

Obtains the solution status.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [out] solsta (*MSKsolstae*) – Solution status.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_getsolution(task, whichsol, prosta, solsta, skc, skx, skn, xc, xx, y, slc, suc, slx, sux, snx)

Obtains the complete solution.

Consider the case of linear programming. The primal problem is given by

$$\begin{array}{ll}
 \text{minimize} & c^T x + c^f \\
 \text{subject to} & l^c \leq Ax \leq u^c, \\
 & l^x \leq x \leq u^x.
 \end{array}$$

and the corresponding dual problem is

$$\begin{aligned}
 & \text{maximize} && (l^c)^T s_l^c - (u^c)^T s_u^c \\
 & && + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\
 & \text{subject to} && A^T y + s_l^x - s_u^x = c, \\
 & && -y + s_l^c - s_u^c = 0, \\
 & && s_l^c, s_u^c, s_l^x, s_u^x \geq 0.
 \end{aligned}$$

In this case the mapping between variables and arguments to the function is as follows:

- **xx** : Corresponds to variable x .
- **y** : Corresponds to variable y .
- **slc**: Corresponds to variable s_l^c .
- **suc**: Corresponds to variable s_u^c .
- **slx**: Corresponds to variable s_l^x .
- **sux**: Corresponds to variable s_u^x .
- **xc** : Corresponds to Ax .

The meaning of the values returned by this function depend on the *solution status* returned in the argument **solsta**. The most important possible values of **solsta** are:

- **MSK_SOL_STA_OPTIMAL** : An optimal solution satisfying the optimality criteria for continuous problems is returned.
- **MSK_SOL_STA_INTEGER_OPTIMAL** : An optimal solution satisfying the optimality criteria for integer problems is returned.
- **MSK_SOL_STA_PRIM_FEAS** : A solution satisfying the feasibility criteria.
- **MSK_SOL_STA_PRIM_INFEAS_CER** : A primal certificate of infeasibility is returned.
- **MSK_SOL_STA_DUAL_INFEAS_CER** : A dual certificate of infeasibility is returned.

Parameters

- [in] **task** (*MSKtask_t*) – An optimization task.
- [in] **whichsol** (*MSKsoltypee*) – Selects a solution.
- [out] **prosta** (*MSKprosta_e*) – Problem status.
- [out] **solsta** (*MSKsolsta_e*) – Solution status.
- [out] **skc** (*MSKsta_keye*) – Status keys for the constraints.
- [out] **skx** (*MSKsta_keye*) – Status keys for the variables.
- [out] **skn** (*MSKsta_keye*) – Status keys for the conic constraints.
- [out] **xc** (*MSKrealt*) – Primal constraint solution.
- [out] **xx** (*MSKrealt*) – Primal variable solution (x).
- [out] **y** (*MSKrealt*) – Vector of dual variables corresponding to the constraints.
- [out] **slc** (*MSKrealt*) – Dual variables corresponding to the lower bounds on the constraints (s_l^c).
- [out] **suc** (*MSKrealt*) – Dual variables corresponding to the upper bounds on the constraints (s_u^c).
- [out] **slx** (*MSKrealt*) – Dual variables corresponding to the lower bounds on the variables (s_l^x).
- [out] **sux** (*MSKrealt*) – Dual variables corresponding to the upper bounds on the variables (appears as s_u^x).

- [out] `snx` (*MSKrealt*) – Dual variables corresponding to the conic constraints on the variables (s_n^x) .

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsolutioni`, `task.getsolutionslice`

`ret = MSK_getsolutioni(task, accmode, i, whichsol, sk, x, sl, su, sn)`

Obtains the primal and dual solution information for a single constraint or variable.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – If set to *MSK_ACC_CON* the solution information for a constraint is retrieved. Otherwise for a variable.
- [in] `i` (*MSKint32t*) – Index of the constraint or variable.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `sk` (*MSKstakeye*) – Status key of the constraint of variable.
- [out] `x` (*MSKrealt*) – Solution value of the primal variable.
- [out] `sl` (*MSKrealt*) – Solution value of the dual variable associated with the lower bound.
- [out] `su` (*MSKrealt*) – Solution value of the dual variable associated with the upper bound.
- [out] `sn` (*MSKrealt*) – Solution value of the dual variable associated with the cone constraint.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsolution`, `task.getsolutionslice`

`ret = MSK_getsolutioninfo(task, whichsol, pobj, pviolcon, pviolvar, pviolbarvar, pviolcone, pviolitg, dobj, dviolcon, dviolvar, dviolbarvar, dviolcone)`

Obtains information about a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `pobj` (*MSKrealt*) – The primal objective value as computed by `task.getprimalobj`.
- [out] `pviolcon` (*MSKrealt*) – Maximal primal violation of the solution associated with the x^c variables where the violations are computed by `task.getpviolcon`.
- [out] `pviolvar` (*MSKrealt*) – Maximal primal violation of the solution for the x^x variables where the violations are computed by `task.getpviolvar`.
- [out] `pviolbarvar` (*MSKrealt*) – Maximal primal violation of solution for the \bar{X} variables where the violations are computed by `task.getpviolbarvar`.
- [out] `pviolcone` (*MSKrealt*) – Maximal primal violation of solution for the conic constraints where the violations are computed by `task.getpviolcones`.
- [out] `pviolitg` (*MSKrealt*) – Maximal violation in the integer constraints. The violation for an integer constrained variable x_j is given by

$$\min(x_j - \lfloor x_j \rfloor, \lceil x_j \rceil - x_j).$$

This number is always zero for the interior-point and the basic solutions.

- [out] `dobj` (*MSKrealt*) – Dual objective value as computed as computed by `task.getdualobj`.

- [out] `dviolcon` (*MSKrealt*) – Maximal violation of the dual solution associated with the x^c variable as computed by `task.getdviolcon`.
- [out] `dviolvar` (*MSKrealt*) – Maximal violation of the dual solution associated with the x variable as computed by `task.getdviolvar`.
- [out] `dviolbarvar` (*MSKrealt*) – Maximal violation of the dual solution associated with the \bar{s} variable as computed by `task.getdviolbarvar`.
- [out] `dviolcone` (*MSKrealt*) – Maximal violation of the dual solution associated with the dual conic constraints as computed by `task.getdviolcones`.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsolsta`, `task.getprimalobj`, `task.getpviolcon`, `task.getpviolvar`,
`task.getpviolbarvar`, `task.getpviolcones`, `task.getdualobj`, `task.getdviolcon`,
`task.getdviolvar`, `task.getdviolbarvar`, `task.getdviolcones`

`ret = MSK_getsolutionslice(task, whichsol, solitem, first, last, values)`

Obtains a slice of the solution.

Consider the case of linear programming. The primal problem is given by

$$\begin{array}{ll} \text{minimize} & c^T x + c^f \\ \text{subject to} & l^c \leq Ax \leq u^c, \\ & l^x \leq x \leq u^x. \end{array}$$

and the corresponding dual problem is

$$\begin{array}{ll} \text{maximize} & (l^c)^T s_l^c - (u^c)^T s_u^c \\ & + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ \text{subject to} & A^T y + s_l^x - s_u^x = c, \\ & -y + s_l^c - s_u^c = 0, \\ & s_l^c, s_u^c, s_l^x, s_u^x \geq 0. \end{array}$$

The `solitem` argument determines which part of the solution is returned:

- MSK_SOL_ITEM_XX* : The variable `values` return x .
- MSK_SOL_ITEM_Y* : The variable `values` return y .
- MSK_SOL_ITEM_SLC* : The variable `values` return s_l^c .
- MSK_SOL_ITEM_SUC* : The variable `values` return s_u^c .
- MSK_SOL_ITEM_SLX* : The variable `values` return s_l^x .
- MSK_SOL_ITEM_SUX* : The variable `values` return s_u^x .

A conic optimization problem has the same primal variables as in the linear case. Recall that the dual of a conic optimization problem is given by:

$$\begin{array}{ll} \text{maximize} & (l^c)^T s_l^c - (u^c)^T s_u^c \\ & + (l^x)^T s_l^x - (u^x)^T s_u^x + c^f \\ \text{subject to} & A^T y + s_l^x - s_u^x + s_n^x = c, \\ & -y + s_l^c - s_u^c = 0, \\ & s_l^c, s_u^c, s_l^x, s_u^x \geq 0, \\ & s_n^x \in \mathcal{K}^* \end{array}$$

This introduces one additional dual variable s_n^x . This variable can be accessed by selecting `solitem` as *MSK_SOL_ITEM_SNX*.

The meaning of the values returned by this function also depends on the *solution status* which can be obtained with `task.getsolsta`. Depending on the solution status `value` will be:

- MSK_SOL_STA_OPTIMAL* A part of the optimal solution satisfying the optimality criteria for continuous problems.

- *MSK_SOL_STA_INTEGER_OPTIMAL* A part of the optimal solution satisfying the optimality criteria for integer problems.
- *MSK_SOL_STA_PRIM_FEAS* A part of the solution satisfying the feasibility criteria.
- *MSK_SOL_STA_PRIM_INFEAS_CER* A part of the primal certificate of infeasibility.
- *MSK_SOL_STA_DUAL_INFEAS_CER* A part of the dual certificate of infeasibility.

Parameters

- [in] *task* (*MSKtask_t*) – An optimization task.
- [in] *whichsol* (*MSKsoltypee*) – Selects a solution.
- [in] *solitem* (*MSKsoliteme*) – Which part of the solution is required.
- [in] *first* (*MSKint32t*) – Index of the first value in the slice.
- [in] *last* (*MSKint32t*) – value of the last index+1 in the slice, e.g. if $xx[5, \dots, 9]$ is required *last* should be 10.
- [out] *values* (*MSKrealt*) – The values in the required sequence are stored sequentially in *values* starting at *values*[\idxbeg].

Return

- *ret* (*MSKrescodee*) – The function response code.

See also

task.getsolution, *task.getsolutioni*

ret = *MSK_getsolutionincallback*(*task*, *where*, *whichsol*, *prosta*, *solsta*, *skc*, *skx*, *skn*, *xc*, *xx*, *y*, *slc*, *suc*, *slx*, *sux*, *snx*)

Obtains the whole or a part of the solution from within a progress call-back. This function must only be called from a progress call-back function.

This is an experimental feature. Please contact **MOSEK** support before using this function.

Parameters

- [in] *task* (*MSKtask_t*) – An optimization task.
- [in] *where* (*MSKcallbackcodee*) – The call-back-key from the current call-back
- [in] *whichsol* (*MSKsoltypee*) – Selects a solution.
- [out] *prosta* (*MSKprostae*) – Problem status.
- [out] *solsta* (*MSKsolstae*) – Solution status.
- [out] *skc* (*MSKstakeye*) – Status keys for the constraints.
- [out] *skx* (*MSKstakeye*) – Status keys for the variables.
- [out] *skn* (*MSKstakeye*) – Status keys for the conic constraints.
- [out] *xc* (*MSKrealt*) – Primal constraint solution.
- [out] *xx* (*MSKrealt*) – Primal variable solution (x).
- [out] *y* (*MSKrealt*) – Vector of dual variables corresponding to the constraints.
- [out] *slc* (*MSKrealt*) – Dual variables corresponding to the lower bounds on the constraints (s_l^c).
- [out] *suc* (*MSKrealt*) – Dual variables corresponding to the upper bounds on the constraints (s_u^c).
- [out] *slx* (*MSKrealt*) – Dual variables corresponding to the lower bounds on the variables (s_l^x).
- [out] *sux* (*MSKrealt*) – Dual variables corresponding to the upper bounds on the variables (appears as s_u^x).

- [out] `snx (MSKreal_t)` – Dual variables corresponding to the conic constraints on the variables (s_n^x) .

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getsparsesymmat(task, idx, maxlen, subi, subj, valij)`

Get a single symmetric matrix from the matrix store.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `idx (MSKint64t)` – Index of the matrix to get.
- [in] `maxlen (MSKint64t)` – Length of the output arrays `subi`, `subj` and `valij`.
- [out] `subi (MSKint32t)` – Row subscripts of the matrix non-zero elements.
- [out] `subj (MSKint32t)` – Column subscripts of the matrix non-zero elements.
- [out] `valij (MSKreal_t)` – Coefficients of the matrix non-zero elements.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getstrparam(task, param, maxlen, len, parvalue)`

Obtains the value of a string parameter.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `param (MSKsparam)` – Which parameter.
- [in] `maxlen (MSKint32t)` – Length of the `parvalue` buffer.
- [out] `len (MSKint32t)` – The length of the parameter value.
- [out] `parvalue (MSKstring_t)` – If this is not NULL, the parameter value is stored here.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getstrparamal(task, param, numaddchr, value)`

Obtains the value of a string parameter.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `param (MSKsparam)` – Which parameter.
- [in] `numaddchr (MSKint32t)` – Number of additional characters that is made room for in `value[\idxbeg]`.
- [io] `value (MSKstring_t)` – Is the value corresponding to string parameter `param`. `value[\idxbeg]` is char buffer allocated **MOSEK** and it must be freed by `task.freetask`.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getstrparamlen(task, param, len)`

Obtains the length of a string parameter.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `param (MSKsparam)` – Which parameter.
- [out] `len (MSKint32t)` – The length of the parameter value.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getsuc(task, whichsol, suc)`

Obtains the s_u^c vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `suc` (*MSKrealt*) – The s_u^c vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsucslice`

`ret = MSK_getsucslice(task, whichsol, first, last, suc)`

Obtains a slice of the s_u^c vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `suc` (*MSKrealt*) – Dual variables corresponding to the upper bounds on the constraints (s_u^c).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsuc`

`ret = MSK_getsux(task, whichsol, sux)`

Obtains the s_u^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `sux` (*MSKrealt*) – The s_u^x vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsuxslice`

`ret = MSK_getsuxslice(task, whichsol, first, last, sux)`

Obtains a slice of the s_u^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `sux` (*MSKrealt*) – Dual variables corresponding to the upper bounds on the variables (appears as s_u^x).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsux`

`ret = MSK_getsymmatinfo(task, idx, dim, nz, type)`

MOSEK maintains a vector denoted by E of symmetric data matrixes. This function makes it possible to obtain important information about an data matrix in E .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `idx` (*MSKint64t*) – Index of the matrix that is requested information about.
- [out] `dim` (*MSKint32t*) – Returns the dimension of the requested matrix.
- [out] `nz` (*MSKint64t*) – Returns the number of non-zeros in the requested matrix.
- [out] `type` (*MSKsymmattypee*) – Returns the type of the requested matrix.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getsymbcon(task, i, maxlen, name, value)`

Obtains the name and corresponding value for the i th symbolic constant.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index.
- [in] `maxlen` (*MSKint32t*) – The length of the buffer pointed to by the `value` argument.
- [out] `name` (*MSKstring_t*) – Name of the i th symbolic constant.
- [out] `value` (*MSKint32t*) – The corresponding value.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_getsymbcondim(env, num, maxlen)`

Obtains the number of symbolic constants defined by **MOSEK** and the maximum length of the name of any symbolic constant.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [out] `num` (*MSKint32t*) – Number of symbolic constants defined by **MOSEK**.
- [out] `maxlen` (*size_t*) – Maximum length of the name of any symbolic constants.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_gettaskname(task, maxlen, taskname)`

Obtains the name assigned to the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxlen` (*MSKint32t*) – Length of the `taskname` array.
- [out] `taskname` (*MSKstring_t*) – Is assigned the task name.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_gettasknamelen(task, len)`

Obtains the length the task name.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `len` (*MSKint32t*) – Returns the length of the task name.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.getbarvarname

```
ret = MSK_getvarbound(task, i, bk, bl, bu)
```

Obtains bound information for one variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index of the variable for which the bound information should be obtained.
- [out] bk (*MSKboundkeye*) – Bound keys.
- [out] bl (*MSKrealt*) – Values for lower bounds.
- [out] bu (*MSKrealt*) – Values for upper bounds.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getvarboundslice(task, first, last, bk, bl, bu)
```

Obtains bounds information for a slice of the variables.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] bk (*MSKboundkeye*) – Bound keys.
- [out] bl (*MSKrealt*) – Values for lower bounds.
- [out] bu (*MSKrealt*) – Values for upper bounds.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_getvarname(task, j, maxlen, name)
```

Obtains a name of a variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] j (*MSKint32t*) – Index.
- [in] maxlen (*MSKint32t*) – The length of the buffer pointed to by the name argument.
- [out] name (*MSKstring_t*) – Returns the required name.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getmaxnamelen

```
ret = MSK_getvarnameindex(task, somename, asgn, index)
```

Checks whether the name *somename* has been assigned to any variable. If it has been assigned to variable, then index of the variable is reported.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] somename (*MSKstring_t*) – The name which should be checked.
- [out] asgn (*MSKint32t*) – Is non-zero if the name *somename* is assigned to a variable.
- [out] index (*MSKint32t*) – If the name *somename* is assigned to a variable, then *index* is the name of the variable.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getvarnamelen(task, i, len)`

Obtains the length of a name of a variable variable.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `i (MSKint32t)` – Index.
- [out] `len (MSKint32t)` – Returns the length of the indicated name.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`task.getbarvarname`

`ret = MSK_getvartype(task, j, vartype)`

Gets the variable type of one variable.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `j (MSKint32t)` – Index of the variable.
- [out] `vartype (MSKvariabletypee)` – Variable type of variable j.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getvartypelist(task, num, subj, vartype)`

Obtains the variable type of one or more variables.

Upon return `vartype[k]` is the variable type of variable `subj[k]`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `num (MSKint32t)` – Number of variables for which the variable type should be obtained.
- [in] `subj (MSKint32t)` – A list of variable indexes.
- [out] `vartype (MSKvariabletypee)` – The variables types corresponding to the variables specified by `subj`.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getversion(major, minor, build, revision)`

Obtains MOSEK version information.

Parameters

- [out] `major (MSKint32t)` – Major version number.
- [out] `minor (MSKint32t)` – Minor version number.
- [out] `build (MSKint32t)` – Build number.
- [out] `revision (MSKint32t)` – Revision number.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_getxc(task, whichsol, xc)`

Obtains the x^c vector for a solution.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `whichsol (MSKsoltypee)` – Selects a solution.
- [out] `xc (MSKrealt)` – The x^c vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getxcslice`

```
ret = MSK_getxcslice(task, whichsol, first, last, xc)
```

Obtains a slice of the x^c vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `xc` (*MSKrealt*) – Primal constraint solution.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getxc`

```
ret = MSK_getxx(task, whichsol, xx)
```

Obtains the x^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `xx` (*MSKrealt*) – The x^x vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getxxslice`

```
ret = MSK_getxxslice(task, whichsol, first, last, xx)
```

Obtains a slice of the x^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `xx` (*MSKrealt*) – Primal variable solution (x).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getxx`

```
ret = MSK_gety(task, whichsol, y)
```

Obtains the y vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `y` (*MSKrealt*) – The y vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getyslice`

```
ret = MSK_getyslice(task, whichsol, first, last, y)
```

Obtains a slice of the y vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [out] `y` (*MSKrealt*) – Vector of dual variables corresponding to the constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.gety`

```
ret = MSK_initbasissolve(task, basis)
```

Prepare a task for use with the `task.solvewithbasis` function.

This function should be called

- immediately before the first call to `task.solvewithbasis`, and
- immediately before any subsequent call to `task.solvewithbasis` if the task has been modified.

If the basis is singular i.e. not invertible, then the error *MSK_RES_ERR_BASIS_SINGULAR (1615)* is reported.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `basis` (*MSKint32t*) – The array of basis indexes to use.

The array is interpreted as follows: If `basis[i] ≤ numcon − 1`, then $x_{\text{basis}[i]}^c$ is in the basis at position i , otherwise $x_{\text{basis}[i] - \text{numcon}}$ is in the basis at position i .

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_inputdata(task, maxnumcon, maxnumvar, numcon, numvar, c, cfix, aptrb, aptre,  
                   asub, aval, bkc, blc, buc, bkx, blx, bux)
```

Input the linear part of an optimization problem.

The non-zeros of A are inputted column-wise in the format described in Section 16.1.3.2.

For an explained code example see Section 3.2 and Section 16.1.3.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumcon` (*MSKint32t*) – Number of preallocated constraints in the optimization task.
- [in] `maxnumvar` (*MSKint32t*) – Number of preallocated variables in the optimization task.
- [in] `numcon` (*MSKint32t*) – Number of constraints.
- [in] `numvar` (*MSKint32t*) – Number of variables.
- [in] `c` (*MSKrealt*) – Linear terms of the objective as a dense vector. The length is the number of variables.
- [in] `cfix` (*MSKrealt*) – Fixed term in the objective.
- [in] `aptrb` (*MSKint32t*) – Pointer to the first element in the rows or the columns of A .

- [in] aptre (*MSKint32t*) – Pointers to the last element + 1 in the rows or the columns of A .
- [in] asub (*MSKint32t*) – Coefficient subscripts. See Section 16.1.3.2.
- [in] aval (*MSKrealt*) – Coefficient values.
- [in] bkc (*MSKboundkeye*) – Bound keys for the constraints.
- [in] blc (*MSKrealt*) – Lower bounds for the constraints.
- [in] buc (*MSKrealt*) – Upper bounds for the constraints.
- [in] bkc (*MSKboundkeye*) – Bound keys for the variables.
- [in] blx (*MSKrealt*) – Lower bounds for the variables.
- [in] bux (*MSKrealt*) – Upper bounds for the variables.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_inputdata64(task, maxnumcon, maxnumvar, numcon, numvar, c, cfix, aptrb, aptre,
                    asub, aval, bkc, blc, buc, bkc, blx, bux)
```

Input the linear part of an optimization problem.

The non-zeros of A are inputted column-wise in the format described in Section 16.1.3.2.

For an explained code example see Section 3.2 and Section 16.1.3.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] maxnumcon (*MSKint32t*) – Number of preallocated constraints in the optimization task.
- [in] maxnumvar (*MSKint32t*) – Number of preallocated variables in the optimization task.
- [in] numcon (*MSKint32t*) – Number of constraints.
- [in] numvar (*MSKint32t*) – Number of variables.
- [in] c (*MSKrealt*) – Linear terms of the objective as a dense vector. The length is the number of variables.
- [in] cfix (*MSKrealt*) – Fixed term in the objective.
- [in] aptrb (*MSKint64t*) – Pointer to the first element in the rows or the columns of A .
- [in] aptre (*MSKint64t*) – Pointers to the last element + 1 in the rows or the columns of A .
- [in] asub (*MSKint32t*) – Coefficient subscripts. See Section 16.1.3.2.
- [in] aval (*MSKrealt*) – Coefficient values.
- [in] bkc (*MSKboundkeye*) – Bound keys for the constraints.
- [in] blc (*MSKrealt*) – Lower bounds for the constraints.
- [in] buc (*MSKrealt*) – Upper bounds for the constraints.
- [in] bkc (*MSKboundkeye*) – Bound keys for the variables.
- [in] blx (*MSKrealt*) – Lower bounds for the variables.
- [in] bux (*MSKrealt*) – Upper bounds for the variables.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_iparvaltosymnam(env, whichparam, whichvalue, symbolicname)
```

Obtains the symbolic name corresponding to a value that can be assigned to an integer parameter.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `whichparam` (*MSKiparam*) – Which parameter.
- [in] `whichvalue` (*MSKint32t*) – Which value.
- [out] `symbolicname` (*MSKstring_t*) – The symbolic name corresponding to `whichvalue`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_isdoupurname(task, parname, param)`

Checks whether `parname` is a valid double parameter name.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `parname` (*MSKstring_t*) – Parameter name.
- [out] `param` (*MSKdparam*) – Which parameter.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_isinfinity(value)`

Return true if `value` considered infinity by **MOSEK**.

Parameters

- [in] `value` (*MSKreal_t*) – The value to be checked

Return

- `ret` (*MSKboolean_t*) – Whether the given value is infinity.

`ret = MSK_isintparname(task, parname, param)`

Checks whether `parname` is a valid integer parameter name.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `parname` (*MSKstring_t*) – Parameter name.
- [out] `param` (*MSKiparam*) – Which parameter.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_isstrparname(task, parname, param)`

Checks whether `parname` is a valid string parameter name.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `parname` (*MSKstring_t*) – Parameter name.
- [out] `param` (*MSKsparam*) – Which parameter.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_licensecleanup()`

Stops all threads and delete all handles used by the license system. If this function is called, it must be called as the last **MOSEK** API call. No other **MOSEK** API calls are valid after this.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_linkfiletoenvstream(env, whichstream, filename, append)`

Directs all output from a stream to a file.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.

- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `filename` (*MSKstring_t*) – Sends all output from the stream defined by `whichstream` to the file given by `filename`.
- [in] `append` (*MSKint32t*) – If this argument is non-zero, the output is appended to the file.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_linkfiletotaskstream(task, whichstream, filename, append)`

Directs all output from a task stream to a file.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `filename` (*MSKstring_t*) – The name of the file where text from the stream defined by `whichstream` is written.
- [in] `append` (*MSKint32t*) – If this argument is 0 the output file will be overwritten, otherwise text is append to the output file.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_linkfunctoenvstream(env, whichstream, handle, func)`

Connects a user-defined function to a stream.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `handle` (*MSKuserhandle_t*) – A user-defined handle which is passed to the user-defined function `func`.
- [in] `func` (*streamfunc*) – All output to the stream `whichstream` is passed to `func`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_linkfunctotaskstream(task, whichstream, handle, func)`

Connects a user-defined function to a task stream.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `handle` (*MSKuserhandle_t*) – A user-defined handle which is passed to the user-defined function `func`.
- [in] `func` (*streamfunc*) – All output to the stream `whichstream` is passed to `func`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_makeemptytask(env, task)`

Creates a new optimization task.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [out] `task` (*MSKtask_t*) – An optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_makeenv(env, dbgfile)
```

Creates a new **MOSEK** environment. The environment must be shared among all tasks in a program.

Parameters

- [out] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] dbgfile (*MSKstring_t*) – A user-defined file debug file.

Return

- ret (*MSKrescodee*) – The function response code.

See also

env.deleteenv

```
ret = MSK_makeenvalloc(env, usrptra, usrmalloc, usrcalloc, usrrealloc, usrfree, dbgfile)
```

Creates a new **MOSEK** environment. The environment must be shared among all tasks in a program.

Parameters

- [out] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] usrptra (*MSKuserhandle_t*) – A pointer to user-defined data structure. The pointer is feed into *usrmalloc* and *usrfree*.
- [in] usrmalloc (*mallocfunc*) – A user-defined *malloc* function or a NULL pointer.
- [in] usrcalloc (*callocfunc*) – A user-defined *calloc* function or a NULL pointer.
- [in] usrrealloc (*reallocfunc*) – A user-defined *realloc* function or a NULL pointer.
- [in] usrfree (*freefunc*) – A user-defined *free* function which is used deallocate space allocated by *usrmalloc*. This function must be defined if *usrmalloc*!=|null|.
- [in] dbgfile (*MSKstring_t*) – A user-defined file debug file.

Return

- ret (*MSKrescodee*) – The function response code.

See also

env.deleteenv

```
ret = MSK_maketask(env, maxnumcon, maxnumvar, task)
```

Creates a new task.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] maxnumcon (*MSKint32t*) – An optional estimate on the maximum number of constraints in the task. Can e.g be 0 if no such estimate is known.
- [in] maxnumvar (*MSKint32t*) – An optional estimate on the maximum number of variables in the task. Can be 0 if no such estimate is known.
- [out] task (*MSKtask_t*) – An optimization task.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_onesolutionsummary(task, whichstream, whichsol)
```

Prints a short summary for a specified solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichstream (*MSKstreamtypee*) – Index of the stream.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.

Return

- ret (*MSKrescodee*) – The function response code.

`ret = MSK_optimize(task)`

Calls the optimizer. Depending on the problem type and the selected optimizer this will call one of the optimizers in **MOSEK**. By default the interior point optimizer will be selected for continuous problems. The optimizer may be selected manually by setting the parameter `MSK_IPAR_OPTIMIZER`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.getsolution`, `task.getsolutioni`, `task.getsolutioninfo`, `MSK_IPAR_OPTIMIZER`

`ret = MSK_optimizermt(task, server, port, trmcode)`

Offload the optimization task to a solver server defined by `server:port`. The call will block until a result is available or the connection closes.

If the string parameter `MSK_SPAR_REMOTE_ACCESS_TOKEN` is not blank, it will be passed to the server as authentication.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `server` (*MSKstring_t*) – Name or IP address of the solver server
- [in] `port` (*MSKstring_t*) – Network port of solver service
- [out] `trmcode` (*MSKrescodee*) – Is either `MSK_RESPONSE_OK` or a termination response code.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.asyncoptimize`, `MSK_SPAR_REMOTE_ACCESS_TOKEN`

`ret = MSK_optimizetrm(task, trmcode)`

Calls the optimizer. Depending on the problem type and the selected optimizer this will call one of the optimizers in **MOSEK**. By default the interior point optimizer will be selected for continuous problems. The optimizer may be selected manually by setting the parameter `MSK_IPAR_OPTIMIZER`.

This function returns errors on the left hand side. Warnings are not returned and termination codes are returned in the separate argument `trmcode`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [out] `trmcode` (*MSKrescodee*) – Is either `MSK_RESPONSE_OK` or a termination response code.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.optimize`, `task.getsolution`, `task.getsolutioni`, `task.getsolutioninfo`, `MSK_IPAR_OPTIMIZER`

`ret = MSK_optimizersummary(task, whichstream)`

Prints a short summary with optimizer statistics for last optimization.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_potrf(env, uplo, n, a)`

Computes a Cholesky factorization of a real symmetric positive definite dense matrix.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `uplo` (*MSKuploe*) – Indicates whether the upper or lower triangular part of the matrix is stored.
- [in] `n` (*MSKint32t*) – Dimension of the symmetric matrix.
- [io] `a` (*MSKrealt*) – A symmetric matrix stored in column-major order. Only the lower or the upper triangular part is used, accordingly with the `uplo` parameter. It will contain the result on exit.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_primalrepair(task, wlc, wuc, wlx, wux)`

The function repairs a primal infeasible optimization problem by adjusting the bounds on the constraints and variables where the adjustment is computed as the minimal weighted sum relaxation to the bounds on the constraints and variables. Observe the function only repairs the problem but does not compute an optimal solution to the repaired problem. If an optimal solution is required the problem should be optimized after the repair.

The function is applicable to linear and conic problems possibly having integer constrained variables.

Observe that when computing the minimal weighted relaxation then the termination tolerance specified by the parameters of the task is employed. For instance the parameter *MSK_IPAR_MIO_MODE* can be used make **MOSEK** ignore the integer constraints during the repair which usually leads to a much faster repair. However, the drawback is of course that the repaired problem may not have an integer feasible solution.

Note the function modifies the bounds on the constraints and variables. If this is not a desired feature, then apply the function to a cloned task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `wlc` (*MSKrealt*) – $(w_l^c)_i$ is the weight associated with relaxing the lower bound on constraint i . If the weight is negative, then the lower bound is not relaxed. Moreover, if the argument is NULL, then all the weights are assumed to be 1.
- [in] `wuc` (*MSKrealt*) – $(w_u^c)_i$ is the weight associated with relaxing the upper bound on constraint i . If the weight is negative, then the upper bound is not relaxed. Moreover, if the argument is NULL, then all the weights are assumed to be 1.
- [in] `wlx` (*MSKrealt*) – $(w_l^x)_j$ is the weight associated with relaxing the upper bound on constraint j . If the weight is negative, then the lower bound is not relaxed. Moreover, if the argument is NULL, then all the weights are assumed to be 1.
- [in] `wux` (*MSKrealt*) – $(w_l^x)_i$ is the weight associated with relaxing the upper bound on variable j . If the weight is negative, then the upper bound is not relaxed. Moreover, if the argument is NULL, then all the weights are assumed to be 1.

Return

- `ret` (*MSKrescodee*) – The function response code.

MSK_DINF_PRIMAL_REPAIR_PENALTY_OBJ

`ret = MSK_primalsensitivity(task, numi, subi, marki, numj, subj, markj, leftpricei, rightpricei, leftrangei, rightrangei, leftpricej, rightpricej, leftrangej, rightrangej)`

Calculates sensitivity information for bounds on variables and constraints.

For details on sensitivity analysis and the definitions of *shadow price* and *linearity interval* see Section 15.

The constraints for which sensitivity analysis is performed are given by the data structures:

1. `subi` Index of constraint to analyze.

2. `marki` Indicate for which bound of constraint `subi[i]` sensitivity analysis is performed. If `marki[i] = MSK_MARK_UP` the upper bound of constraint `subi[i]` is analyzed, and if `marki[i] = MSK_MARK_LO` the lower bound is analyzed. If `subi[i]` is an equality constraint, either `MSK_MARK_LO` or `MSK_MARK_UP` can be used to select the constraint for sensitivity analysis.

Consider the problem:

$$\begin{array}{ll} \text{minimize} & x_1 + x_2 \\ \text{subject to} & -1 \leq x_1 - x_2 \leq 1, \\ & x_1 = 0, \\ & x_1 \geq 0, x_2 \geq 0 \end{array}$$

Suppose that

- `numi = 1;`
- `subi = [0];`
- `marki = [MSK_MARK_UP]`

then

`leftpricei[0]`, `rightpricei[0]`, `leftrangei[0]` and `rightrangei[0]` will contain the sensitivity information for the upper bound on constraint 0 given by the expression:

$$x_1 - x_2 \leq 1$$

Similarly, the variables for which to perform sensitivity analysis are given by the structures:

1. `subj` Index of variables to analyze.

2. `markj` Indicate for which bound of variable `subi[j]` sensitivity analysis is performed. If `markj[j] = MSK_MARK_UP` the upper bound of constraint `subi[j]` is analyzed, and if `markj[j] = MSK_MARK_LO` the lower bound is analyzed.

3. If `subi[j]` is an equality constraint, either `MSK_MARK_LO` or `MSK_MARK_UP` can be used to select the constraint for sensitivity analysis.

For an example, please see Section 15.1.4.

The type of sensitivity analysis to be performed (basis or optimal partition) is controlled by the parameter `MSK_IPAR_SENSITIVITY_TYPE`.

Parameters

- `[in] task (MSKtask_t)` – An optimization task.
- `[in] numi (MSKint32t)` – Number of bounds on constraints to be analyzed. Length of `subi` and `marki`.
- `[in] subi (MSKint32t)` – Indexes of bounds on constraints to analyze.
- `[in] marki (MSKmarke)` – The value of `marki[i]` specifies for which bound (upper or lower) on constraint `subi[i]` sensitivity analysis should be performed.
- `[in] numj (MSKint32t)` – Number of bounds on variables to be analyzed. Length of `subj` and `markj`.
- `[in] subj (MSKint32t)` – Indexes of bounds on variables to analyze.
- `[in] markj (MSKmarke)` – The value of `markj[j]` specifies for which bound (upper or lower) on variable `subj[j]` sensitivity analysis should be performed.
- `[out] leftpricei (MSKrealt)` – `leftpricei[i]` is the left shadow price for the upper/lower bound (indicated by `marki[i]`) of the constraint with index `subi[i]`.
- `[out] rightpricei (MSKrealt)` – `rightpricei[i]` is the right shadow price for the upper/lower bound (indicated by `marki[i]`) of the constraint with index `subi[i]`.

- [out] `leftrangei` (*MSKrealt*) – `leftrangei[i]` is the left range for the upper/lower bound (indicated by `marki[i]`) of the constraint with index `subi[i]`.
- [out] `rightrangei` (*MSKrealt*) – `rightrangei[i]` is the right range for the upper/lower bound (indicated by `marki[i]`) of the constraint with index `subi[i]`.
- [out] `leftpricej` (*MSKrealt*) – `leftpricej[j]` is the left shadow price for the upper/lower bound (indicated by `marki[j]`) on variable `subj[j]`.
- [out] `rightpricej` (*MSKrealt*) – `rightpricej[j]` is the right shadow price for the upper/lower bound (indicated by `marki[j]`) on variable `subj[j]`.
- [out] `leftrangej` (*MSKrealt*) – `leftrangej[j]` is the left range for the upper/lower bound (indicated by `marki[j]`) on variable `subj[j]`.
- [out] `rightrangej` (*MSKrealt*) – `rightrangej[j]` is the right range for the upper/lower bound (indicated by `marki[j]`) on variable `subj[j]`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_printdata(task, whichstream, firsti, lasti, firstj, lastj, firstk, lastk, c, qo,
a, qc, bc, bx, vartype, cones)`

Prints a part of the problem data to a stream. This function is normally used for debugging purposes only, e.g. to verify that the correct data has been inputted.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.
- [in] `firsti` (*MSKint32t*) – Index of first constraint for which data should be printed.
- [in] `lasti` (*MSKint32t*) – Index of last constraint plus 1 for which data should be printed.
- [in] `firstj` (*MSKint32t*) – Index of first variable for which data should be printed.
- [in] `lastj` (*MSKint32t*) – Index of last variable plus 1 for which data should be printed.
- [in] `firstk` (*MSKint32t*) – Index of first cone for which data should be printed.
- [in] `lastk` (*MSKint32t*) – Index of last cone plus 1 for which data should be printed.
- [in] `c` (*MSKint32t*) – If non-zero c is printed.
- [in] `qo` (*MSKint32t*) – If non-zero Q^o is printed.
- [in] `a` (*MSKint32t*) – If non-zero A is printed.
- [in] `qc` (*MSKint32t*) – If non-zero Q^k is printed for the relevant constraints.
- [in] `bc` (*MSKint32t*) – If non-zero the constraints bounds are printed.
- [in] `bx` (*MSKint32t*) – If non-zero the variable bounds are printed.
- [in] `vartype` (*MSKint32t*) – If non-zero the variable types are printed.
- [in] `cones` (*MSKint32t*) – If non-zero the conic data is printed.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_printparam(task)`

Prints the current parameter settings to the message stream.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_prostatostr(task, prosta, str)`

Obtains a string containing the name of a problem status given.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `prosta (MSKprosta_e)` – Problem status.
- [out] `str (MSKstring_t)` – String corresponding to the status key `prosta`.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_probtypetostr(task, probtype, str)`

Obtains a string containing the name of a problem type given.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `probtype (MSKprobtype_e)` – Problem type.
- [out] `str (MSKstring_t)` – String corresponding to the problem type key `probtype`.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_putacol(task, j, nzj, subj, valj)`

Resets all the elements in column j to zero and then do

$$A_{\text{subj}[k],j} = \text{valj}[k], \quad k = 0, \dots, \text{nzj} - 1.$$

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `j (MSKint32t)` – Index of column in A .
- [in] `nzj (MSKint32t)` – Number of non-zeros in column j of A .
- [in] `subj (MSKint32t)` – Row indexes of non-zero values in column j of A .
- [in] `valj (MSKreal_t)` – New non-zero values of column j in A .

Return

- `ret (MSKrescodee)` – The function response code.

`task.putmaxnumanz`

`ret = MSK_putacollist(task, num, sub, ptrb, ptre, asub, aval)`

Replaces all elements in a set of columns of A . The elements are replaced as follows

$$\text{for } i = 0, \dots, \text{num} - 1 \\ a_{\text{asub}[k], \text{sub}[i]} = \text{aval}[k], \quad k = \text{aptrb}[i], \dots, \text{aptre}[i] - 1.$$

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `num (MSKint32t)` – Number of columns of A to replace.
- [in] `sub (MSKint32t)` – Indexes of columns that should be replaced. `comp` should not contain duplicate values.
- [in] `ptrb (MSKint32t)` – Array of pointers to the first element in the columns stored in `comp` and `comp`.

For an explanation of the meaning of `comp` see Section 16.1.3.2.

- [in] `ptre` (*MSKint32t*) – Array of pointers to the last element plus one in the columns stored in `comp` and `comp`.

For an explanation of the meaning of `comp` see Section 16.1.3.2.

- [in] `asub` (*MSKint32t*) – `comp` contains the new variable indexes.
- [in] `aval` (*MSKrealt*) – Coefficient values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putmaxnumanz`, `task.putacollist64`

`ret = MSK_putacollist64(task, num, sub, ptrb, ptre, asub, aval)`

Replaces all elements in a set of columns of A . The elements are replaced as follows

$$\begin{aligned} \text{for } i = 0, \dots, \text{num} - 1 \\ a_{\text{asub}[k], \text{sub}[i]} = \text{aval}[k], \quad k = \text{ptrb}[i], \dots, \text{ptre}[i] - 1. \end{aligned}$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of columns of A to replace.
- [in] `sub` (*MSKint32t*) – Indexes of columns that should be replaced. `comp` should not contain duplicate values.
- [in] `ptrb` (*MSKint64t*) – Array of pointers to the first element in the columns stored in `comp` and `comp`.

For an explanation of the meaning of `comp` see Section 16.1.3.2.

- [in] `ptre` (*MSKint64t*) – Array of pointers to the last element plus one in the columns stored in `comp` and `comp`.
- For an explanation of the meaning of `comp` see Section 16.1.3.2.
- [in] `asub` (*MSKint32t*) – `comp` contains the new variable indexes.
- [in] `aval` (*MSKrealt*) – Coefficient values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putmaxnumanz`

`ret = MSK_putacolslice(task, first, last, ptrb, ptre, asub, aval)`

Replaces all elements in a set of columns of A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – First column in the slice.
- [in] `last` (*MSKint32t*) – Last column plus one in the slice.
- [in] `ptrb` (*MSKint32t*) – Array of pointers to the first element in the columns stored in `comp` and `comp`.

For an explanation of the meaning of `comp` see Section 16.1.3.2.

- [in] `ptre` (*MSKint32t*) – Array of pointers to the last element plus one in the columns stored in `comp` and `comp`.
- For an explanation of the meaning of `comp` see Section 16.1.3.2.
- [in] `asub` (*MSKint32t*) – `comp` contains the new variable indexes.
- [in] `aval` (*MSKrealt*) – Coefficient values.

Return

- `ret` (*MSKrescodee*) – The function response code.

task.putacolslice64, *task.putarowslice*, *task.putmaxnumanz*

`ret = MSK_putacolslice64(task, first, last, ptrb, ptre, asub, aval)`

Replaces all elements in a set of columns of A .

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – First column in the slice.
- [in] `last` (*MSKint32t*) – Last column plus one in the slice.
- [in] `ptrb` (*MSKint64t*) – Array of pointers to the first element in the columns stored in `comp` and `comp`.

For an explanation of the meaning of `comp` see Section 16.1.3.2.

- [in] `ptre` (*MSKint64t*) – Array of pointers to the last element plus one in the columns stored in `comp` and `comp`.

For an explanation of the meaning of `comp` see Section 16.1.3.2.

- [in] `asub` (*MSKint32t*) – `comp` contains the new variable indexes.
- [in] `aval` (*MSKrealt*) – Coefficient values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putmaxnumanz

`ret = MSK_putarow(task, i, nzi, subi, vali)`

Resets all the elements in row i to zero and then do

$$A_{i, \text{subi}[k]} = \text{vali}[k], \quad k = 0, \dots, \text{nzi} - 1.$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of row in A .
- [in] `nzi` (*MSKint32t*) – Number of non-zeros in row i of A .
- [in] `subi` (*MSKint32t*) – Row indexes of non-zero values in row i of A .
- [in] `vali` (*MSKrealt*) – New non-zero values of row i in A .

Return

- `ret` (*MSKrescodee*) – The function response code.

`task.putarowlist`, `task.putarowlist64`, `task.putmaxnumanz`

`ret = MSK_putaij(task, i, j, aij)`

Changes a coefficient in A using the method

$$a_{ij} = a_{ij}.$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of the constraint in which the change should occur.
- [in] `j` (*MSKint32t*) – Index of the variable in which the change should occur.
- [in] `aij` (*MSKrealt*) – New coefficient for $a_{i,j}$.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putarow`, `task.putacol`, `task.putaijlist`, `task.putmaxnumanz`

`ret = MSK_putaijlist(task, num, subi, subj, valij)`
 Changes one or more coefficients in A using the method

$$a_{\text{subi}[k], \text{subj}[k]} = \text{valij}[k], \quad k = 0, \dots, \text{num} - 1.$$

Multiple elements are not allowed.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of coefficients that should be changed.
- [in] `subi` (*MSKint32t*) – Constraint indexes in which the change should occur.
- [in] `subj` (*MSKint32t*) – Variable indexes in which the change should occur.
- [in] `valij` (*MSKreal_t*) – New coefficient values for $a_{i,j}$.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putarow`, `task.putacol`, `task.putaij`, `task.putmaxnumanz`

`ret = MSK_putaijlist64(task, num, subi, subj, valij)`
 Changes one or more coefficients in A using the method

$$a_{\text{subi}[k], \text{subj}[k]} = \text{valij}[k], \quad k = 0, \dots, \text{num} - 1.$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint64t*) – Number of coefficients that should be changed.
- [in] `subi` (*MSKint32t*) – Constraint indexes in which the change should occur.
- [in] `subj` (*MSKint32t*) – Variable indexes in which the change should occur.
- [in] `valij` (*MSKreal_t*) – New coefficient values for $a_{i,j}$.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putarow`, `task.putacol`, `task.putaij`, `task.putmaxnumanz`

`ret = MSK_putbarablocktriplet(task, num, subi, subj, subk, subl, valijkl)`
 Inputs the \bar{A} in block triplet form.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint64t*) – Number of elements in the block triplet form.
- [in] `subi` (*MSKint32t*) – Constraint index.
- [in] `subj` (*MSKint32t*) – Symmetric matrix variable index.
- [in] `subk` (*MSKint32t*) – Block row index.
- [in] `subl` (*MSKint32t*) – Block column index.
- [in] `valijkl` (*MSKreal_t*) – The numerical value associated with the block triplet.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putbaraij(task, i, j, num, sub, weights)`
 This function puts one element associated with \bar{X}_j in the \bar{A} matrix.

Each element in the \bar{A} matrix is a weighted sum of symmetric matrixes, i.e. \bar{A}_{ij} is a symmetric matrix with dimensions as \bar{X}_j . By default all elements in \bar{A} are 0, so only non-zero elements need be added.

Setting the same elements again will overwrite the earlier entry.

The symmetric matrixes themselves are defined separately using the function `task.appendsparsesymmat`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Row index of \bar{A} .
- [in] `j` (*MSKint32t*) – Column index of \bar{A} .
- [in] `num` (*MSKint64t*) – The number of terms in the weighted sum that forms \bar{A}_{ij} .
- [in] `sub` (*MSKint64t*) – See argument `weights` for an explanation.
- [in] `weights` (*MSKrealt*) – `weights[k]` times `sub[k]`’th term of E is added to \bar{A}_{ij} .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putbarcblocktriplet(task, num, subj, subk, subl, valjkl)`

Inputs the \bar{C} in block triplet form.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint64t*) – Number of elements in the block triplet form.
- [in] `subj` (*MSKint32t*) – Symmetric matrix variable index.
- [in] `subk` (*MSKint32t*) – Block row index.
- [in] `subl` (*MSKint32t*) – Block column index.
- [in] `valjkl` (*MSKrealt*) – The numerical value associated with the block triplet.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putbarcj(task, j, num, sub, weights)`

This function puts one element associated with \bar{X}_j in the \bar{c} vector.

Each element in the \bar{c} vector is a weighted sum of symmetric matrixes, i.e. \bar{c}_j is a symmetric matrix with dimensions as \bar{X}_j . By default all elements in \bar{c} are 0, so only non-zero elements need be added.

Setting the same elements again will overwrite the earlier entry.

The symmetric matrixes themselves are defined separately using the function `task.appendsparsesymmat`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `j` (*MSKint32t*) – Index of the element in \bar{c} that should be changed.
- [in] `num` (*MSKint64t*) – The number elements appearing in the sum that forms \bar{c}_j .
- [in] `sub` (*MSKint64t*) – `sub` is list of indexes of those symmetric matrices appearing in sum.
- [in] `weights` (*MSKrealt*) – The weights of the terms in the weighted sum that forms \bar{c}_j .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putbarsj(task, whichsol, j, barsj)`

Sets the dual solution for a semidefinite variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] j (*MSKint32t*) – Index of the semidefinite variable.
- [in] barsj (*MSKrealt*) – Value of \bar{s}_j .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putbarvarname(task, j, name)

Puts the name of a semidefinite variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] j (*MSKint32t*) – Index of the variable.
- [in] name (*MSKstring_t*) – The variable name.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.getbarvarnamelen

ret = MSK_putbarxj(task, whichsol, j, barxj)

Sets the primal solution for a semidefinite variable.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] j (*MSKint32t*) – Index of the semidefinite variable.
- [in] barxj (*MSKrealt*) – Value of \bar{X}_j .

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putbound(task, accmode, i, bk, bl, bu)

Changes the bounds for either one constraint or one variable.

If the a bound value specified is numerically larger than *MSK_DPAR_DATA_TOL_BOUND_INF* it is considered infinite and the bound key is changed accordingly. If a bound value is numerically larger than *MSK_DPAR_DATA_TOL_BOUND_WRN*, a warning will be displayed, but the bound is inputted as specified.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] accmode (*MSKaccmodee*) – Defines whether the bound for a constraint or a variable is changed.
- [in] i (*MSKint32t*) – Index of the constraint or variable.
- [in] bk (*MSKboundkeye*) – New bound key.
- [in] bl (*MSKrealt*) – New lower bound.
- [in] bu (*MSKrealt*) – New upper bound.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putboundlist

```
ret = MSK_putboundlist(task, accmode, num, sub, bk, bl, bu)
```

Changes the bounds for either some constraints or variables. If multiple bound changes are specified for a constraint or a variable, only the last change takes effect.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – Defines whether bounds for constraints (*MSK_ACC_CON*) or variables (*MSK_ACC_VAR*) are changed.
- [in] `num` (*MSKint32t*) – Number of bounds that should be changed.
- [in] `sub` (*MSKint32t*) – Subscripts of the bounds that should be changed.
- [in] `bk` (*MSKboundkeye*) – Constraint or variable index `sub[t]` is assigned the bound key `bk[t]`.
- [in] `bl` (*MSKrealt*) – Constraint or variable index `sub[t]` is assigned the lower bound `bl[t]`.
- [in] `bu` (*MSKrealt*) – Constraint or variable index `sub[t]` is assigned the upper bound `bu[t]`.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putbound`, `MSK_DPAR_DATA_TOL_BOUND_INF`, `MSK_DPAR_DATA_TOL_BOUND_WRN`

```
ret = MSK_putboundslice(task, con, first, last, bk, bl, bu)
```

Changes the bounds for a sequence of variables or constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `con` (*MSKaccmodee*) – Defines whether bounds for constraints (*MSK_ACC_CON*) or variables (*MSK_ACC_VAR*) are changed.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] `bk` (*MSKboundkeye*) – Bound keys.
- [in] `bl` (*MSKrealt*) – Values for lower bounds.
- [in] `bu` (*MSKrealt*) – Values for upper bounds.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putbound`, `MSK_DPAR_DATA_TOL_BOUND_INF`, `MSK_DPAR_DATA_TOL_BOUND_WRN`

```
ret = MSK_putcj(task, j, cj)
```

Modifies one coefficient in the linear objective vector c , i.e.

$$c_j = cj.$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `j` (*MSKint32t*) – Index of the variable for which c should be changed.
- [in] `cj` (*MSKrealt*) – New value of c_j .

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putclist`, `task.putcslice`

```
ret = MSK_putclist(task, num, subj, val)
```

Modifies elements in the linear term c in the objective using the principle

$$c_{\text{subj}[t]} = \text{val}[t], \quad t = 0, \dots, \text{num} - 1.$$

If a variable index is specified multiple times in `subj` only the last entry is used.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of coefficients that should be changed.
- [in] `subj` (*MSKint32t*) – Index of variables for which c should be changed.
- [in] `val` (*MSKreal_t*) – New numerical values for coefficients in c that should be modified.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putcslice(task, first, last, slice)
```

Modifies a slice in the linear term c in the objective using the principle

$$c_j = \text{slice}[j - \text{first}], \quad j = \text{first}, \dots, \text{last} - 1$$

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – First element in the slice of c .
- [in] `last` (*MSKint32t*) – Last element plus 1 of the slice in c to be changed.
- [in] `slice` (*MSKreal_t*) – New numerical values for coefficients in c that should be modified.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putcallbackfunc(task, func, handle)
```

The function is used to input a user-defined progress call-back function of type `:msk:type'callbackfunc'`. The call-back function is called frequently during the optimization process.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `func` (*callbackfunc*) – A user-defined function which will be called occasionally from within the MOSEK optimizers. If the argument is a NULL pointer, then a previous inputted call-back function removed. The progress function has the type *callbackfunc*.
- [in] `handle` (*MSKuserhandle_t*) – A pointer to a user-defined data structure. Whenever the function *callbackfunc* is called, then `handle` is passed to the function.

Return

- ret (*MSKrescodee*) – The function response code.

See also

MSK_IPAR_LOG_SIM_FREQ

```
ret = MSK_putcfix(task, cfix)
```

Replaces the fixed term in the objective by a new one.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `cfix` (*MSKreal_t*) – Fixed term in the objective.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putconbound(task, i, bk, bl, bu)
```

Changes the bounds for one constraint.

If the a bound value specified is numerically larger than `MSK_DPAR_DATA_TOL_BOUND_INF` it is considered infinite and the bound key is changed accordingly. If a bound value is numerically larger than `MSK_DPAR_DATA_TOL_BOUND_WRN`, a warning will be displayed, but the bound is inputted as specified.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of the constraint.
- [in] `bk` (*MSKboundkeye*) – New bound key.
- [in] `bl` (*MSKrealt*) – New lower bound.
- [in] `bu` (*MSKrealt*) – New upper bound.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putconboundslice`

```
ret = MSK_putconboundlist(task, num, sub, bkc, blc, buc)
```

Changes the bounds for a list of constraints. If multiple bound changes are specified for a constraint, then only the last change takes effect.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of bounds that should be changed.
- [in] `sub` (*MSKint32t*) – List constraints indexes.
- [in] `bkc` (*MSKboundkeye*) – New bound keys.
- [in] `blc` (*MSKrealt*) – New lower bound values.
- [in] `buc` (*MSKrealt*) – New upper bound values.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putconbound`, `task.putconboundslice`, `MSK_DPAR_DATA_TOL_BOUND_INF`, `MSK_DPAR_DATA_TOL_BOUND_WRN`

```
ret = MSK_putconboundslice(task, first, last, bk, bl, bu)
```

Changes the bounds for a slice of the constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – Index of the first constraint in the slice.
- [in] `last` (*MSKint32t*) – Index of the last constraint in the slice plus 1.
- [in] `bk` (*MSKboundkeye*) – New bound keys.
- [in] `bl` (*MSKrealt*) – New lower bounds.
- [in] `bu` (*MSKrealt*) – New upper bounds.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putconbound`, `task.putconboundlist`

```
ret = MSK_putconname(task, i, name)
```

Puts the name of a constraint.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] i (*MSKint32t*) – Index of the constraint.
- [in] name (*MSKstring_t*) – The variable name.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putcone(task, k, ct, coneapar, nummem, submem)

Replaces a conic constraint.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] k (*MSKint32t*) – Index of the cone.
- [in] ct (*MSKconetypee*) – Specifies the type of the cone.
- [in] coneapar (*MSKrealt*) – This argument is currently not used. It can be set to 0
- [in] nummem (*MSKint32t*) – Number of member variables in the cone.
- [in] submem (*MSKint32t*) – Variable subscripts of the members in the cone.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putconename(task, j, name)

Puts the name of a cone.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] j (*MSKint32t*) – Index of the cone.
- [in] name (*MSKstring_t*) – The variable name.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putdouparam(task, param, parvalue)

Sets the value of a double parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] param (*MSKdparam*) – Which parameter.
- [in] parvalue (*MSKrealt*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putexitfunc(env, exitfunc, handle)

In case **MOSEK** has a fatal error, then an exit function is called. The exit function should terminate **MOSEK**. In general it is not necessary to define an exit function.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] exitfunc (*exitfunc*) – A user-defined exit function.
- [in] handle (*MSKuserhandle_t*) – A pointer to user-defined data structure which is passed to exitfunc when called.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putintparam(task, param, parvalue)
```

Sets the value of an integer parameter.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] param (*MSKiparam*) – Which parameter.
- [in] parvalue (*MSKint32t*) – Parameter value.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putlicensecode(env, code)
```

The purpose of this function is to input a runtime license code.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] code (*MSKint32t*) – A runtime license code.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putlicensedebug(env, licdebug)
```

If licdebug is non-zero, then **MOSEK** will print debug info regarding the license checkout.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] licdebug (*MSKint32t*) – If this argument is non-zero, then **MOSEK** will print debug info regarding the license checkout.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putlicensepath(env, licensepath)
```

Set the path to the license file.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] licensepath (*MSKstring_t*) – A path specifying where to search for the license.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putlicensesewait(env, licwait)
```

If licwait is non-zero, then **MOSEK** will wait for a license if no license is available. Moreover, licwait-1 is the number of milliseconds to wait between each check for an available license.

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] licwait (*MSKint32t*) – If this argument is non-zero, then **MOSEK** will wait for a license if no license is available. Moreover, licwait-1 is the number of milliseconds to wait between each check for an available license.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putmaxnumanz(task, maxnumanz)
```

MOSEK stores only the non-zero elements in A . Therefore **MOSEK** cannot predict how much storage is required to store A . Using this function it is possible to specify the number of non-zeros to preallocate for storing A .

If the number of non-zeros in the problem is known, it is a good idea to set maxnumanz slightly larger than this number, otherwise a rough estimate can be used. In general, if A is inputted in many small chunks, setting this value may speed up the data input phase.

It is not mandatory to call this function, since **MOSEK** will reallocate internal structures whenever it is necessary.

Observe the function call has no effect if both `maxnumcon` and `maxnumvar` is zero.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumanz` (*MSKint64t*) – New size of the storage reserved for storing A .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putmaxnumbarvar(task, maxnumbarvar)`

Sets the number of preallocated symmetric matrix variables in the optimization task. When this number of variables is reached **MOSEK** will automatically allocate more space for variables.

It is not mandatory to call this function, since its only function is to give a hint of the amount of data to preallocate for efficiency reasons.

Please note that `maxnumbarvar` must be larger than the current number of variables in the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumbarvar` (*MSKint32t*) – The maximum number of semidefinite variables.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putmaxnumcon(task, maxnumcon)`

Sets the number of preallocated constraints in the optimization task. When this number of constraints is reached **MOSEK** will automatically allocate more space for constraints.

It is never mandatory to call this function, since **MOSEK** will reallocate any internal structures whenever it is required.

Please note that `maxnumcon` must be larger than the current number of constraints in the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumcon` (*MSKint32t*) – Number of preallocated constraints in the optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putmaxnumcone(task, maxnumcone)`

Sets the number of preallocated conic constraints in the optimization task. When this number of conic constraints is reached **MOSEK** will automatically allocate more space for conic constraints.

It is never mandatory to call this function, since **MOSEK** will reallocate any internal structures whenever it is required.

Please note that `maxnumcon` must be larger than the current number of constraints in the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumcone` (*MSKint32t*) – Number of preallocated conic constraints in the optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putmaxnumqnz(task, maxnumqnz)`

MOSEK stores only the non-zero elements in Q . Therefore, **MOSEK** cannot predict how much storage is required to store Q . Using this function it is possible to specify the number non-zeros to preallocate for storing Q (both objective and constraints).

It may be advantageous to reserve more non-zeros for Q than actually needed since it may improve the internal efficiency of **MOSEK**, however, it is never worthwhile to specify more than the double of the anticipated number of non-zeros in Q .

It is never mandatory to call this function, since its only function is to give a hint of the amount of data to preallocate for efficiency reasons.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumqnz` (*MSKint64t*) – Number of non-zero elements preallocated in quadratic coefficient matrices.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putmaxnumvar(task, maxnumvar)`

Sets the number of preallocated variables in the optimization task. When this number of variables is reached **MOSEK** will automatically allocate more space for variables.

It is never mandatory to call this function, since its only function is to give a hint of the amount of data to preallocate for efficiency reasons.

Please note that `maxnumvar` must be larger than the current number of variables in the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumvar` (*MSKint32t*) – Number of preallocated variables in the optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putnadoupparam(task, paramname, parvalue)`

Sets the value of a named double parameter.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `paramname` (*MSKstring_t*) – Name of a parameter.
- [in] `parvalue` (*MSKrealt*) – Parameter value.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putnaintparam(task, paramname, parvalue)`

Sets the value of a named integer parameter.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `paramname` (*MSKstring_t*) – Name of a parameter.
- [in] `parvalue` (*MSKint32t*) – Parameter value.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putnastrparam(task, paramname, parvalue)`

Sets the value of a named string parameter.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `paramname` (*MSKstring_t*) – Name of a parameter.
- [in] `parvalue` (*MSKstring_t*) – Parameter value.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putnlfunc(task, nlhandle, nlgetsp, nlgetva)`

This function is used to communicate the nonlinear function information to **MOSEK**.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `nlhandle` (*MSKuserhandle_t*) – A pointer to a user-defined data structure. It is passed to the functions `nlgetsp` and `nlgetva` whenever those two functions called.
- [in] `nlgetsp` (*nlgetspfunc*) – A user-defined function which provide information about the structure of the nonlinear functions in the optimization problem.
- [in] `nlgetva` (*nlgetvafunc*) – A user-defined function which is used to evaluate the nonlinear function in the optimization problem at a given point.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putobjname(task, objname)`

Assigns the name given by `objname` to the objective function.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `objname` (*MSKstring_t*) – Name of the objective.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putobjsense(task, sense)`

Sets the objective sense of the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `sense` (*MSKobjsensee*) – The objective sense of the task. The values *MSK_OBJECTIVE_SENSE_MAXIMIZE* and *MSK_OBJECTIVE_SENSE_MINIMIZE* means that the problem is maximized or minimized respectively.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.getobjsense

`ret = MSK_putparam(task, parname, parvalue)`

Checks if a `parname` is valid parameter name. If it is, the parameter is assigned the value specified by `parvalue`.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `parname` (*MSKstring_t*) – Parameter name.
- [in] `parvalue` (*MSKstring_t*) – Parameter value.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putqcon(task, numqcnz, qcsbk, qcsbi, qcsubj, qcval)`

Replace all quadratic entries in the constraints. consider constraints on the form:

$$l_k^c \leq \frac{1}{2} \sum_{i=0}^{numvar-1} \sum_{j=0}^{numvar-1} q_{ij}^k x_i x_j + \sum_{j=0}^{numvar-1} a_{kj} x_j \leq u_k^c, \quad k = 0, \dots, m-1.$$

the function assigns values to q such that:

$$q_{qcsbi[t], qcsubj[t]}^{qcsbk[t]} = qcval[t], \quad t = 0, \dots, numqcnz - 1.$$

and

$$q_{\text{qcsbj}[t], \text{qcsubi}[t]}^{\text{qcsubk}[t]} = \text{qcval}[t], \quad t = 0, \dots, \text{numqcnz} - 1.$$

values not assigned are set to zero.

Please note that duplicate entries are added together.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `numqcnz` (*MSKint32t*) – Number of quadratic terms.
- [in] `qcsubk` (*MSKint32t*) – k subscripts for q_{ij}^k .
- [in] `qcsubi` (*MSKint32t*) – i subscripts for q_{ij}^k .
- [in] `qcsbj` (*MSKint32t*) – j subscripts for q_{ij}^k .
- [in] `qcval` (*MSKreal_t*) – Numerical value for q_{ij}^k .

Return

- `ret` (*MSKrescode_e*) – The function response code.

See also

`task.putqcnk`, `task.putmaxnumqnz`

`ret = MSK_putqcnk(task, k, numqcnz, qcsubi, qcsbj, qcval)`

Replaces all the quadratic entries in one constraint k of the form:

$$l_k^c \leq \frac{1}{2} \sum_{i=0}^{\text{numvar}-1} \sum_{j=0}^{\text{numvar}-1} q_{ij}^k x_i x_j + \sum_{j=0}^{\text{numvar}-1} a_{kj} x_j \leq u_k^c.$$

It is assumed that Q^k is symmetric, i.e. $q_{ij}^k = q_{ji}^k$, and therefore, only the values of q_{ij}^k for which $i \geq j$ should be inputted to **MOSEK**. To be precise, **MOSEK** uses the following procedure

1. $Q^k = 0$
2. for $t = 0$ to $\text{numqcnz} - 1$
3. $q_{\text{qcsubi}[t], \text{qcsbj}[t]}^k = q_{\text{qcsubi}[t], \text{qcsbj}[t]}^k + \text{qcval}[t]$
3. $q_{\text{qcsbj}[t], \text{qcsubi}[t]}^k = q_{\text{qcsbj}[t], \text{qcsubi}[t]}^k + \text{qcval}[t]$

Please note that:

- For large problems it is essential for the efficiency that the function `task.putmaxnumqnz` is employed to specify an appropriate `maxnumqnz`.
- Only the lower triangular part should be specified because Q^k is symmetric. Specifying values for q_{ij}^k where $i < j$ will result in an error.
- Only non-zero elements should be specified.
- The order in which the non-zero elements are specified is insignificant.
- Duplicate elements are added together. Hence, it is recommended not to specify the same element multiple times in `qcsubi`, `qcsbj`, and `qcval`.

For a code example see Section 3.5

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `k` (*MSKint32t*) – The constraint in which the new Q elements are inserted.
- [in] `numqcnz` (*MSKint32t*) – Number of quadratic terms.
- [in] `qcsubi` (*MSKint32t*) – i subscripts for q_{ij}^k .

- [in] `qcsbj` (*MSKint32t*) – j subscripts for q_{ij}^k .
- [in] `qcval` (*MSKreal t*) – Numerical value for q_{ij}^k .

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putqcon`, `task.putmaxnumqnz`

`ret = MSK_putqobj(task, numqonz, qosubi, qosubj, qoval)`

Replaces all the quadratic terms in the objective

$$\frac{1}{2} \sum_{i=0}^{numvar-1} \sum_{j=0}^{numvar-1} q_{ij}^o x_i x_j + \sum_{j=0}^{numvar-1} c_j x_j + c^f.$$

It is assumed that Q^o is symmetric, i.e. $q_{ij}^o = q_{ji}^o$, and therefore, only the values of q_{ij}^o for which $i \geq j$ should be specified. To be precise, **MOSEK** uses the following procedure

1. $Q^o = 0$
2. for $t = 0$ to $numqonz - 1$
3. $q_{qosubi[t], qosubj[t]}^o = q_{qosubi[t], qosubj[t]}^o + qoval[t]$
3. $q_{qosubj[t], qosubi[t]}^o = q_{qosubj[t], qosubi[t]}^o + qoval[t]$

Please note that:

- Only the lower triangular part should be specified because Q^o is symmetric. Specifying values for q_{ij}^o where $i < j$ will result in an error.
- Only non-zero elements should be specified.
- The order in which the non-zero elements are specified is insignificant.
- Duplicate entries are added to together.

For a code example see Section 3.5.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `numqonz` (*MSKint32t*) – Number of non-zero elements in Q^o .
- [in] `qosubi` (*MSKint32t*) – i subscript for q_{ij}^o .
- [in] `qosubj` (*MSKint32t*) – j subscript for q_{ij}^o .
- [in] `qoval` (*MSKreal t*) – Numerical value for q_{ij}^o .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putqobjij(task, i, j, qoij)`

Replaces one coefficient in the quadratic term in the objective. The function performs the assignment

$$q_{ij}^o = qoij.$$

Only the elements in the lower triangular part are accepted. Setting q_{ij} with $j > i$ will cause an error.

Please note that replacing all quadratic element, one at a time, is more computationally expensive than replacing all elements at once. Use `task.putqobj` instead whenever possible.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Row index for the coefficient to be replaced.
- [in] `j` (*MSKint32t*) – Column index for the coefficient to be replaced.

- [in] `qoij` (*MSKreal_t*) – The new value for q_{ij}^o .

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putresponsefunc(task, responsefunc, handle)`

Inputs a user-defined error call-back which is called when an error or warning occurs.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `responsefunc` (*responsefunc*) – A user-defined response handling function.
- [in] `handle` (*MSKuserhandle_t*) – A user-defined data structure that is passed to the function `responsefunc` whenever it is called.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putskc(task, whichsol, skc)`

Sets the status keys for the constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `skc` (*MSKstakeye*) – Status keys for the constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putskcslice

`ret = MSK_putskcslice(task, whichsol, first, last, skc)`

Sets the status keys for the constraints.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] `skc` (*MSKstakeye*) – Status keys for the constraints.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putskc

`ret = MSK_putskx(task, whichsol, skx)`

Sets the status keys for the scalar variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `skx` (*MSKstakeye*) – Status keys for the variables.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putskxslice

`ret = MSK_putskxslice(task, whichsol, first, last, skx)`

Sets the status keys for the variables.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] skx (*MSKstakeye*) – Status keys for the variables.

Return

- ret (*MSKrescodee*) – The function response code.

ret = MSK_putslc(task, whichsol, slc)

Sets the s_l^c vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] slc (*MSKrealt*) – The s_l^c vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putslcslice

ret = MSK_putslcslice(task, whichsol, first, last, slc)

Sets a slice of the s_l^c vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] slc (*MSKrealt*) – Dual variables corresponding to the lower bounds on the constraints (s_l^c).

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putslc

ret = MSK_putslx(task, whichsol, slx)

Sets the s_l^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] slx (*MSKrealt*) – The s_l^x vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putslx

ret = MSK_putslxslice(task, whichsol, first, last, slx)

Sets a slice of the s_l^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.

- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] `slx` (*MSKrealt*) – Dual variables corresponding to the lower bounds on the variables (s_l^x).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putslx`

`ret = MSK_putsnx(task, whichsol, sux)`

Sets the s_n^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `sux` (*MSKrealt*) – The s_n^x vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putsnxslice`

`ret = MSK_putsnxslice(task, whichsol, first, last, snx)`

Sets a slice of the s_n^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] `snx` (*MSKrealt*) – Dual variables corresponding to the conic constraints on the variables (s_n^x).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putsnx`

`ret = MSK_putsolution(task, whichsol, skc, skx, skn, xc, xx, y, slc, suc, slx, sux, snx)`

Inserts a solution into the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `skc` (*MSKstakeye*) – Status keys for the constraints.
- [in] `skx` (*MSKstakeye*) – Status keys for the variables.
- [in] `skn` (*MSKstakeye*) – Status keys for the conic constraints.
- [in] `xc` (*MSKrealt*) – Primal constraint solution.
- [in] `xx` (*MSKrealt*) – Primal variable solution (x).
- [in] `y` (*MSKrealt*) – Vector of dual variables corresponding to the constraints.
- [in] `slc` (*MSKrealt*) – Dual variables corresponding to the lower bounds on the constraints (s_l^c).

- [in] `suc` (*MSKrealt*) – Dual variables corresponding to the upper bounds on the constraints (s_u^c).
- [in] `slx` (*MSKrealt*) – Dual variables corresponding to the lower bounds on the variables (s_l^x).
- [in] `sux` (*MSKrealt*) – Dual variables corresponding to the upper bounds on the variables (appears as s_u^x).
- [in] `snx` (*MSKrealt*) – Dual variables corresponding to the conic constraints on the variables (s_n^x).

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putsolutioni(task, accmode, i, whichsol, sk, x, sl, su, sn)`

Sets the primal and dual solution information for a single constraint or variable.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `accmode` (*MSKaccmodee*) – If set to *MSK_ACC_CON* the solution information for a constraint is modified. Otherwise for a variable.
- [in] `i` (*MSKint32t*) – Index of the constraint or variable.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `sk` (*MSKstakeye*) – Status key of the constraint or variable.
- [in] `x` (*MSKrealt*) – Solution value of the primal constraint or variable.
- [in] `sl` (*MSKrealt*) – Solution value of the dual variable associated with the lower bound.
- [in] `su` (*MSKrealt*) – Solution value of the dual variable associated with the upper bound.
- [in] `sn` (*MSKrealt*) – Solution value of the dual variable associated with the cone constraint.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putsolutionyi(task, i, whichsol, y)`

Inputs the dual variable of a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `i` (*MSKint32t*) – Index of the dual variable.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `y` (*MSKrealt*) – Solution value of the dual variable.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putsolutioni

`ret = MSK_putstrparam(task, param, parvalue)`

Sets the value of a string parameter.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `param` (*MSKsparam*) – Which parameter.
- [in] `parvalue` (*MSKstring_t*) – Parameter value.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putsuc(task, whichsol, suc)`

Sets the s_u^c vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `suc` (*MSKrealt*) – The s_u^c vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putsucslice

`ret = MSK_putsucslice(task, whichsol, first, last, suc)`

Sets a slice of the s_u^c vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] `suc` (*MSKrealt*) – Dual variables corresponding to the upper bounds on the constraints (s_u^c).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putsuc

`ret = MSK_putsux(task, whichsol, sux)`

Sets the s_u^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `sux` (*MSKrealt*) – The s_u^x vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putsuxslice

`ret = MSK_putsuxslice(task, whichsol, first, last, sux)`

Sets a slice of the s_u^x vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `first` (*MSKint32t*) – First index in the sequence.
- [in] `last` (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] `sux` (*MSKrealt*) – Dual variables corresponding to the upper bounds on the variables (appears as s_u^x).

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putsux

```
ret = MSK_puttaskname(task, taskname)
```

Assigns the name `taskname` to the task.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `taskname` (*MSKstring_t*) – Name assigned to the task.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_putvarbound(task, j, bk, bl, bu)
```

Changes the bounds for one variable.

If the a bound value specified is numerically larger than *MSK_DPAR_DATA_TOL_BOUND_INF* it is considered infinite and the bound key is changed accordingly. If a bound value is numerically larger than *MSK_DPAR_DATA_TOL_BOUND_WRN*, a warning will be displayed, but the bound is inputted as specified.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `j` (*MSKint32t*) – Index of the variable.
- [in] `bk` (*MSKboundkeye*) – New bound key.
- [in] `bl` (*MSKrealt*) – New lower bound.
- [in] `bu` (*MSKrealt*) – New upper bound.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putvarboundslice

```
ret = MSK_putvarboundlist(task, num, sub, bxx, blx, bux)
```

Changes the bounds for one or more variables. If multiple bound changes are specified for a variable, then only the last change takes effect.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of bounds that should be changed.
- [in] `sub` (*MSKint32t*) – List of variable indexes.
- [in] `bxx` (*MSKboundkeye*) – New bound keys.
- [in] `blx` (*MSKrealt*) – New lower bound values.
- [in] `bux` (*MSKrealt*) – New upper bound values.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putvarbound, *task.putvarboundslice*, *MSK_DPAR_DATA_TOL_BOUND_INF*, *MSK_DPAR_DATA_TOL_BOUND_WRN*

```
ret = MSK_putvarboundslice(task, first, last, bk, bl, bu)
```

Changes the bounds for a slice of the variables.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `first` (*MSKint32t*) – Index of the first variable in the slice.
- [in] `last` (*MSKint32t*) – Index of the last variable in the slice plus 1.
- [in] `bk` (*MSKboundkeye*) – New bound keys.
- [in] `bl` (*MSKrealt*) – New lower bounds.

- [in] `bu` (*MSKrealt*) – New upper bounds.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putconbound

`ret = MSK_putvarname(task, j, name)`

Puts the name of a variable.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `j` (*MSKint32t*) – Index of the variable.
- [in] `name` (*MSKstring_t*) – The variable name.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_putvartype(task, j, vartype)`

Sets the variable type of one variable.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `j` (*MSKint32t*) – Index of the variable.
- [in] `vartype` (*MSKvariabletypee*) – The new variable type.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putvartypelist

`ret = MSK_putvartypelist(task, num, subj, vartype)`

Sets the variable type for one or more variables, i.e. variable number `subj[k]` is assigned the variable type `vartype[k]`.

If the same index is specified multiple times in `subj` only the last entry takes effect.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of variables for which the variable type should be set.
- [in] `subj` (*MSKint32t*) – A list of variable indexes for which the variable type should be changed.
- [in] `vartype` (*MSKvariabletypee*) – A list of variable types that should be assigned to the variables specified by `subj`. See *MSKvariabletypee* for the possible values of `vartype`.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putvartype

`ret = MSK_putxc(task, whichsol, xc)`

Sets the x^c vector for a solution.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `xc` (*MSKrealt*) – The x^c vector.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.putxcslice

```
ret = MSK_putxcslice(task, whichsol, first, last, xc)
```

Sets a slice of the x^c vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] xc (*MSKrealt*) – Primal constraint solution.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putxx

```
ret = MSK_putxx(task, whichsol, xx)
```

Sets the x^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] xx (*MSKrealt*) – The x^x vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putxxslice

```
ret = MSK_putxxslice(task, whichsol, first, last, xx)
```

Obtains a slice of the x^x vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] xx (*MSKrealt*) – Primal variable solution (x).

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putxy

```
ret = MSK_putxy(task, whichsol, y)
```

Sets the y vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] y (*MSKrealt*) – The y vector.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.putyslice

```
ret = MSK_putyslice(task, whichsol, first, last, y)
```

Sets a slice of the y vector for a solution.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] whichsol (*MSKsoltypee*) – Selects a solution.
- [in] first (*MSKint32t*) – First index in the sequence.
- [in] last (*MSKint32t*) – Last index plus 1 in the sequence.
- [in] y (*MSKrealt*) – Vector of dual variables corresponding to the constraints.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.puty

```
ret = MSK_readdata(task, filename)
```

Reads an optimization problem and associated data from a file.

The data file format is determined by the *MSK_IPAR_READ_DATA_FORMAT* parameter. By default the parameter has the value *MSK_DATA_FORMAT_EXTENSION* indicating that the extension of the input file should determine the file type, where the extension is interpreted as follows:

- .lp and .lp.gz are interpreted as an LP file and a compressed LP file respectively.
- .opf and .opf.gz are interpreted as an OPF file and a compressed OPF file respectively.
- .mps and .mps.gz are interpreted as an MPS file and a compressed MPS file respectively.
- .task and .task.gz are interpreted as an task file and a compressed task file respectively.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] filename (*MSKstring_t*) – Data is read from the file *filename* if it is a nonempty string. Otherwise data is read from the file specified by *MSK_SPAR_DATA_FILE_NAME*.

Return

- ret (*MSKrescodee*) – The function response code.

See also

task.writedata, *MSK_IPAR_READ_DATA_FORMAT*

```
ret = MSK_readdataautoformat(task, filename)
```

Reads an optimization problem and associated data from a file.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] filename (*MSKstring_t*) – Data is read from the file *filename*.

Return

- ret (*MSKrescodee*) – The function response code.

See also

MSK_IPAR_READ_DATA_FORMAT

```
ret = MSK_readdataformat(task, filename, format, compress)
```

Reads an optimization problem and associated data from a file.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.
- [in] filename (*MSKstring_t*) – Data is read from the file *filename*.
- [in] format (*MSKdataformate*) – File data format.
- [in] compress (*MSKcompressstypee*) – File compression type.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`MSK_IPAR_READ_DATA_FORMAT`

`ret = MSK_readparamfile(task, filename)`

Reads a parameter file.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `filename (MSKstring_t)` – Data is read from the file `filename` if it is a nonempty string. Otherwise data is read from the file specified by `MSK_SPAR_PARAM_READ_FILE_NAME`.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_readsolution(task, whichsol, filename)`

Reads a solution file and inserts the solution into the solution `whichsol`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `whichsol (MSKsoltypee)` – Selects a solution.
- [in] `filename (MSKstring_t)` – A valid file name.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_readsummary(task, whichstream)`

Prints a short summary of last file that was read.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `whichstream (MSKstreamtypee)` – Index of the stream.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_readtask(task, filename)`

Load task data from a file, replacing any data that already is in the task object. All problem data are resorted, but if the file contains solutions, the solution status after loading a file is still unknown, even if it was optimal or otherwise well-defined when the file was dumped.

See section 17.6 for a description of the Task format.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `filename (MSKstring_t)` – Input file name.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_removebarvars(task, num, subset)`

The function removes a subset of the symmetric matrix from the optimization task. This implies that the existing symmetric matrix are renumbered, for instance if constraint 5 is removed then constraint 6 becomes constraint 5 and so forth.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `num (MSKint32t)` – Number of symmetric matrix which should be removed.
- [in] `subset (MSKint32t)` – Indexes of symmetric matrix which should be removed.

Return

- `ret (MSKrescodee)` – The function response code.

See also

task.appendbarvars

`ret = MSK_removecones(task, num, subset)`

Removes a number conic constraint from the problem. In general, it is much more efficient to remove a cone with a high index than a low index.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of cones which should be removed.
- [in] `subset` (*MSKint32t*) – Indexes of cones which should be removed.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_removecons(task, num, subset)`

The function removes a subset of the constraints from the optimization task. This implies that the existing constraints are renumbered, for instance if constraint 5 is removed then constraint 6 becomes constraint 5 and so forth.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of constraints which should be removed.
- [in] `subset` (*MSKint32t*) – Indexes of constraints which should be removed.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.appendcons

`ret = MSK_removevars(task, num, subset)`

The function removes a subset of the variables from the optimization task. This implies that the existing variables are renumbered, for instance if constraint 5 is removed then constraint 6 becomes constraint 5 and so forth.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `num` (*MSKint32t*) – Number of variables which should be removed.
- [in] `subset` (*MSKint32t*) – Indexes of variables which should be removed.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

task.appendvars

`ret = MSK_resizetask(task, maxnumcon, maxnumvar, maxnumcone, maxnumanz, maxnumqnz)`

Sets the amount of preallocated space assigned for each type of data in an optimization task.

It is never mandatory to call this function, since its only function is to give a hint of the amount of data to preallocate for efficiency reasons.

Please note that the procedure is **destructive** in the sense that all existing data stored in the task is destroyed.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `maxnumcon` (*MSKint32t*) – New maximum number of constraints.
- [in] `maxnumvar` (*MSKint32t*) – New maximum number of variables.
- [in] `maxnumcone` (*MSKint32t*) – New maximum number of cones.
- [in] `maxnumanz` (*MSKint64t*) – New maximum number of non-zeros in A .

- [in] `maxnumqnz` (*MSKint64t*) – New maximum number of non-zeros in all Q matrices.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.putmaxnumvar`, `task.putmaxnumcon`, `task.putmaxnumcone`, `task.putmaxnumanz`,
`task.putmaxnumqnz`

`ret = MSK_sensitivityreport(task, whichstream)`

Reads a sensitivity format file from a location given by *MSK_SPAR_SENSITIVITY_FILE_NAME* and writes the result to the stream `whichstream`. If *MSK_SPAR_SENSITIVITY_RES_FILE_NAME* is set to a non-empty string, then the sensitivity report is also written to a file of this name.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.

Return

- `ret` (*MSKrescodee*) – The function response code.

See also

`task.dualsensitivity`, `task.primalsensitivity`, *MSK_IPAR_LOG_SENSITIVITY*,
MSK_IPAR_LOG_SENSITIVITY_OPT, *MSK_IPAR_SENSITIVITY_TYPE*

`ret = MSK_setdefaults(task)`

Resets all the parameters to their default values.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_sktostr(task, sk, str)`

Obtains an explanatory string corresponding to a status key.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `sk` (*MSKstakeye*) – A valid status key.
- [out] `str` (*MSKstring_t*) – String corresponding to the status key `sk`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_solstatostr(task, solsta, str)`

Obtains an explanatory string corresponding to a solution status.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `solsta` (*MSKsolstae*) – Solution status.
- [out] `str` (*MSKstring_t*) – String corresponding to the solution status `solsta`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_solutiondef(task, whichsol, isdef)`

Checks whether a solution is defined.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [out] `isdef` (*MSKboolean_t*) – Is non-zero if the requested solution is defined.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_solutionsummary(task, whichstream)`

Prints a short summary of the current solutions.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichstream` (*MSKstreamtypee*) – Index of the stream.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_solvewithbasis(task, transp, numnz, sub, val)`

If a basic solution is available, then exactly `numcon` basis variables are defined. These `numcon` basis variables are denoted the basis. Associated with the basis is a basis matrix denoted B . This function solves either the linear equation system

$$B\bar{X} = b \quad (16.3)$$

or the system

$$B^T\bar{X} = b \quad (16.4)$$

for the unknowns \bar{X} , with b being a user-defined vector.

In order to make sense of the solution \bar{X} it is important to know the ordering of the variables in the basis because the ordering specifies how B is constructed. When calling `task.initbasissolve` an ordering of the basis variables is obtained, which can be used to deduce how MOSEK has constructed B . Indeed if the k th basis variable is variable x_j it implies that

$$B_{i,k} = A_{i,j}, \quad i = 0, \dots, \text{numcon} - 1.$$

Otherwise if the k th basis variable is variable x_j^c it implies that

$$B_{i,k} = \begin{cases} -1, & i = j, \\ 0, & i \neq j. \end{cases}$$

Given the knowledge of how B is constructed it is possible to interpret the solution \bar{X} correctly.

Please note that this function exploits the sparsity in the vector b to speed up the computations.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `transp` (*MSKint32t*) – If this argument is non-zero, then (16.4) is solved. Otherwise the system (16.3) is solved.
- [io] `numnz` (*MSKint32t*) – As input it is the number of non-zeros in b . As output it is the number of non-zeros in \bar{X} .
- [io] `sub` (*MSKint32t*) – As input it contains the positions of the non-zeros in b , i.e.

$$b[\text{sub}[k]] \neq 0, \quad k = 0, \dots, \text{numnz}[0] - 1.$$

As output it contains the positions of the non-zeros in \bar{X} . It is important that `sub` has room for `numcon` elements.

- [io] `val` (*MSKrealt*) – As input it is the vector b . Although the positions of the non-zero elements are specified in `sub` it is required that `val[i] = 0` if `b[i] = 0`. As output `val` is the vector \bar{X} .

Please note that `val` is a dense vector — not a packed sparse vector. This implies that `val` has room for `numcon` elements.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`task.initbasissolve`, `MSK_IPAR_BASIS_SOLVE_USE_PLUS_ONE`

```
ret = MSK_sparsetriangularsolvedense(env, transposed, n, lnzc, lptrc, lensubnval, lsubc,
                                     lvalc, b)
```

The function can be used to a triangular system of the form

$$Lx = b$$

or

$$L^T x = b$$

where L is a sparse lower triangular nonsingular matrix. This implies in particular that diagonals in L are nonzero.

Parameters

- [in] `env (MSKenv_t)` – The **MOSEK** environment.
- [in] `transposed (MSKtransposee)` – Controls whether the solve is with L or L^T .
- [in] `n (MSKint32t)` – L is an n times n matrix.
- [in] `lnzc (MSKint32t)` – `lnzc[j]` is the number of nonzeros in column j .
- [in] `lptrc (MSKint64t)` – `lptrc[j]` is a pointer to the first row index and value in column j .
- [in] `lensubnval (MSKint64t)` – Number of elements in `lsubc` and `lvalc`.
- [in] `lsubc (MSKint32t)` – Row indexes for each column stored sequentially. Must be stored increasing order for each column.
- [in] `lvalc (MSKrealt)` – The value corresponding to row indexed stored `lsubc`.
- [io] `b (MSKrealt)` – The right-hand side of linear equation system to be solved.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`env.computesparsecholesky`

```
ret = MSK_strdupdbgtask(task, str, file, line)
```

Make a copy of a string. The string created by this procedure must be freed by `task.freetask`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `str (MSKstring_t)` – String that should be copied.
- [in] `file (MSKstring_t)` – File from which the function is called.
- [in] `line (unsigned)` – Line in the file from which the function is called.

Return

- `ret (MSKstring_t)` – A copy of the given string

```
ret = MSK_strdupctask(task, str)
```

Make a copy of a string. The string created by this procedure must be freed by `task.freetask`.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `str (MSKstring_t)` – String that should be copied.

Return

- `ret (MSKstring_t)` – A copy of the given string.

`ret = MSK_strtoconetype(task, str, conetype)`

Obtains cone type code corresponding to a cone type string.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `str` (*MSKstring_t*) – String corresponding to the cone type code `codetype`.
- [out] `conetype` (*MSKconetypeee*) – The cone type corresponding to the string `str`.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_strtosk(task, str, sk)`

Obtains the status key corresponding to an explanatory string.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `str` (*MSKstring_t*) – Status key string.
- [out] `sk` (*MSKint32t*) – Status key corresponding to the string.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_sy eig(env, uplo, n, a, w)`

Computes all eigenvalues of a real symmetric matrix A . Eigenvalues are stored in the w array.

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `uplo` (*MSKuploe*) – Indicates whether the upper or lower triangular part is used.
- [in] `n` (*MSKint32t*) – Dimension of the symmetric input matrix.
- [in] `a` (*MSKrealt*) – A symmetric matrix stored in column-major order. Only the lower-triangular part is used.
- [out] `w` (*MSKrealt*) – Array of minimum dimension n where eigenvalues will be stored.

Return

- `ret` (*MSKrescodee*) – The function response code.

`ret = MSK_sy evd(env, uplo, n, a, w)`

Computes all the eigenvalues and eigenvectors a real symmetric matrix.

Given the input matrix $A \in \mathbb{R}^{n \times n}$, this function returns a vector $w \in \mathbb{R}^n$ containing the eigenvalues of A and the corresponding eigenvectors, stored in A as well.

Therefore, this function compute the eigenvalue decomposition of A as

$$A = UVU^T,$$

where $V = \text{diag}(w)$ and U contains the eigen-vectors of A .

Parameters

- [in] `env` (*MSKenv_t*) – The **MOSEK** environment.
- [in] `uplo` (*MSKuploe*) – Indicates whether the upper or lower triangular part is used.
- [in] `n` (*MSKint32t*) – Dimension of symmetric input matrix.
- [io] `a` (*MSKrealt*) – A symmetric matrix stored in column-major order. Only the lower-triangular part is used. It will be overwritten on exit.
- [out] `w` (*MSKrealt*) – An array where eigenvalues will be stored. Its lenght must be at least the dimension of the input matrix.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_symnamtovalue(name, value)
```

Obtains the value corresponding to a symbolic name defined by **MOSEK**.

Parameters

- [in] name (*MSKstring_t*) – Symbolic name.
- [out] value (*MSKstring_t*) – The corresponding value.

Return

- ret (*MSKboolean_t*) – Whether the symbolic name has been converted

```
ret = MSK_syrk(env, uplo, trans, n, k, alpha, a, beta, c)
```

Performs a symmetric rank- k update for a symmetric matrix.

Given a symmetric matrix $C \in \mathbb{R}^{n \times n}$, two scalars α, β and a matrix A of rank $k \leq n$, it computes either

$$C = \alpha AA^T + \beta C,$$

or

$$C = \alpha A^T A + \beta C.$$

In the first case $A \in \mathbb{R}^{k \times n}$, in the second $A \in \mathbb{R}^{n \times k}$.

Note that the results overwrite the matrix C .

Parameters

- [in] env (*MSKenv_t*) – The **MOSEK** environment.
- [in] uplo (*MSKuploe*) – Indicates whether the upper or lower triangular part of C is stored.
- [in] trans (*MSKtransposee*) – Indicates whether the matrix A must be transposed.
- [in] n (*MSKint32t*) – Specifies the order of C .
- [in] k (*MSKint32t*) – Indicates the number of rows or columns of A , and its rank.
- [in] alpha (*MSKreal_t*) – A scalar value multiplying the result of the matrix multiplication.
- [in] a (*MSKreal_t*) – The pointer to the array storing matrix A in a column-major format.
- [in] beta (*MSKreal_t*) – A scalar value that multiplies C .
- [io] c (*MSKreal_t*) – The pointer to the array storing matrix C in a column-major format.

Return

- ret (*MSKrescodee*) – The function response code.

```
ret = MSK_toconic(task)
```

This function tries to reformulate a given Quadratically Constrained Quadratic Optimization problem (QCQP) as a Conic Quadratic Optimization problem (CQO). The first step of the reformulation is to convert the quadratic term of the objective function as a constraint, if any. Then the following steps are repeated for each quadratic constraint:

- a conic constraint is added along with a suitable number of auxiliary variables and constraints;
- the original quadratic constraint is not removed, but all its coefficients are zeroed out.

Note that the reformulation preserves all the original variables.

The conversion is performed in-place, i.e. the task passed as argument is modified on exit. That also means that if the reformulation fails, i.e. the given QCQP is not representable as a CQO, then the task has an undefined state. In some cases, users may want to clone the task to ensure a clean copy is preserved.

Parameters

- [in] task (*MSKtask_t*) – An optimization task.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_unlinkfuncfromenvstream(env, whichstream)`

Disconnects a user-defined function from a stream.

Parameters

- [in] `env (MSKenv_t)` – The **MOSEK** environment.
- [in] `whichstream (MSKstreamtypee)` – Index of the stream.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_unlinkfuncfromtaskstream(task, whichstream)`

Disconnects a user-defined function from a task stream.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `whichstream (MSKstreamtypee)` – Index of the stream.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_updatesolutioninfo(task, whichsol)`

Update the information items related to the solution.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `whichsol (MSKsoltypee)` – Selects a solution.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_utf8towchar(outputlen, len, conv, output, input)`

Converts an UTF8 string to a wchar string.

Parameters

- [in] `outputlen (size_t)` – The length of the output buffer.
- [out] `len (size_t*)` – The length of the string contained in the output buffer.
- [out] `conv (size_t*)` – Returns the number of characters from converted, i.e. `input[conv]` is the first char which was not converted. If the whole string was converted, then `input[conv]=0`.
- [out] `output (MSKwchar_t)` – The input string converted to a wchar string.
- [in] `input (MSKstring_t)` – The UTF8 input string.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_wchartoutf8(outputlen, len, conv, output, input)`

Converts an UTF8 string to a wchar string.

Parameters

- [in] `outputlen (size_t)` – The length of the output buffer.
- [out] `len (size_t*)` – The length of the string contained in the output buffer.
- [out] `conv (size_t*)` – Returns the number of characters from converted, i.e. `input[conv]` is the first char which was not converted. If the whole string was converted, then `input[conv]=0`.
- [out] `output (MSKstring_t)` – The input string converted to a wchar string.
- [in] `input (MSKwchar_t)` – The UTF8 input string.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_whichparam(task, parname, partype, param)`

Checks if `parname` is valid parameter name. If yes then, `partype` and `param` denotes the type and the index of parameter respectively.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `parname (MSKstring_t)` – Parameter name.
- [out] `partype (MSKparametertypee)` – Parameter type.
- [out] `param (MSKint32t)` – Which parameter.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_writedata(task, filename)`

Writes problem data associated with the optimization task to a file in one of the supported formats. See Section 17 for the complete list.

By default the data file format is determined by the file name extension. This behaviour can be overridden by setting the `MSK_IPAR_WRITE_DATA_FORMAT` parameter.

MOSEK is able to read and write files in a compressed format (gzip). To write in the compressed format append the extension `.gz`. E.g to write a gzip compressed MPS file use the extension `mps.gz`.

Please note that MPS, LP and OPF files require all variables to have unique names. If a task contains no names, it is possible to write the file with automatically generated anonymous names by setting the `MSK_IPAR_WRITE_GENERIC_NAMES` parameter to `MSK_ON`.

Please note that if a general nonlinear function appears in the problem then such function *cannot* be written to file and **MOSEK** will issue a warning.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `filename (MSKstring_t)` – Data is written to the file `filename` if it is a nonempty string. Otherwise data is written to the file specified by `MSK_SPAR_DATA_FILE_NAME`.

Return

- `ret (MSKrescodee)` – The function response code.

See also

`task.readdata`, `MSK_IPAR_WRITE_DATA_FORMAT`

`ret = MSK_writejsonsol(task, filename)`

Saves the current solutions and solver information items in a JSON file.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `filename (MSKstring_t)` – A valid file name.

Return

- `ret (MSKrescodee)` – The function response code.

`ret = MSK_writeparamfile(task, filename)`

Writes all the parameters to a parameter file.

Parameters

- [in] `task (MSKtask_t)` – An optimization task.
- [in] `filename (MSKstring_t)` – The name of parameter file.

Return

- `ret (MSKrescodee)` – The function response code.

```
ret = MSK_writesolution(task, whichsol, filename)
```

Saves the current basic, interior-point, or integer solution to a file.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `whichsol` (*MSKsoltypee*) – Selects a solution.
- [in] `filename` (*MSKstring_t*) – A valid file name.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_writetask(task, filename)
```

Write a binary dump of the task data. This format saves all problem data, but not callback-functions and general non-linear terms.

See section 17.6 for a description of the Task format.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `filename` (*MSKstring_t*) – Output file name.

Return

- `ret` (*MSKrescodee*) – The function response code.

```
ret = MSK_writetasksolverresult_file(task, filename)
```

Internal

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [in] `filename` (*MSKstring_t*) – A valid file name.

Return

- `ret` (*MSKrescodee*) – The function response code.

16.4.1 Parameters List (alphabetically)

Double Parameters

MSK_DPAR_ANA_SOL_INFEAS_TOL

If a constraint violates its bound with an amount larger than this value, the constraint name, index and violation will be printed by the solution analyzer.

Accepted Values: [0.0 ;+inf]

Default Value: 1e-6

Groups: *Analysis*

MSK_DPAR_BASIS_REL_TOL_S

Maximum relative dual bound violation allowed in an optimal basic solution.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-12

Groups: *Simplex optimizer, Termination criterion*

MSK_DPAR_BASIS_TOL_S

Maximum absolute dual bound violation in an optimal basic solution.

Accepted Values: [1.0e-9 ;+inf]

Default Value: 1.0e-6

Groups: *Simplex optimizer, Termination criterion*

MSK_DPAR_BASIS_TOL_X

Maximum absolute primal bound violation allowed in an optimal basic solution.

Accepted Values: [1.0e-9 ;+inf]

Default Value: 1.0e-6

Groups: *Simplex optimizer, Termination criterion*

MSK_DPAR_CHECK_CONVEXITY_REL_TOL

This parameter controls when the full convexity check declares a problem to be non-convex. Increasing this tolerance relaxes the criteria for declaring the problem non-convex.

A problem is declared non-convex if negative (positive) pivot elements are detected in the Cholesky factor of a matrix which is required to be PSD (NSD). This parameter controls how much this non-negativity requirement may be violated.

If d_i is the pivot element for column i , then the matrix Q is considered to not be PSD if:

$$d_i \leq -|Q_{ii}| \text{check_convexity_rel_tol}$$

Accepted Values: $[0 ; +\infty]$

Default Value: 1e-10

Groups: *Interior-point method*

MSK_DPAR_DATA_SYM_MAT_TOL

Absolute zero tolerance for elements in symmetric matrixes. If any value in a symmetric matrix is smaller than this parameter in absolute terms **MOSEK** will treat the values as zero and generate a warning.

Accepted Values: $[1.0\text{e-}16 ; 1.0\text{e-}6]$

Default Value: 1.0e-12

Groups: *Data check*

MSK_DPAR_DATA_SYM_MAT_TOL_HUGE

An element in a symmetric matrix which is larger than this value in absolute size causes an error.

Accepted Values: $[0.0 ; +\infty]$

Default Value: 1.0e20

Groups: *Data check*

MSK_DPAR_DATA_SYM_MAT_TOL_LARGE

An element in a symmetric matrix which is larger than this value in absolute size causes a warning message to be printed.

Accepted Values: $[0.0 ; +\infty]$

Default Value: 1.0e10

Groups: *Data check*

MSK_DPAR_DATA_TOL_AIJ

Absolute zero tolerance for elements in A . If any value A_{ij} is smaller than this parameter in absolute terms **MOSEK** will treat the values as zero and generate a warning.

Accepted Values: $[1.0\text{e-}16 ; 1.0\text{e-}6]$

Default Value: 1.0e-12

Groups: *Data check*

MSK_DPAR_DATA_TOL_AIJ_HUGE

An element in A which is larger than this value in absolute size causes an error.

Accepted Values: $[0.0 ; +\infty]$

Default Value: 1.0e20

Groups: *Data check*

MSK_DPAR_DATA_TOL_AIJ_LARGE

An element in A which is larger than this value in absolute size causes a warning message to be printed.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e10

Groups: *Data check*

MSK_DPAR_DATA_TOL_BOUND_INF

Any bound which in absolute value is greater than this parameter is considered infinite.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e16

Groups: *Data check*

MSK_DPAR_DATA_TOL_BOUND_WRN

If a bound value is larger than this value in absolute size, then a warning message is issued.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e8

Groups: *Data check*

MSK_DPAR_DATA_TOL_CJ_LARGE

An element in c which is larger than this value in absolute terms causes a warning message to be printed.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e8

Groups: *Data check*

MSK_DPAR_DATA_TOL_C_HUGE

An element in c which is larger than the value of this parameter in absolute terms is considered to be huge and generates an error.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e16

Groups: *Data check*

MSK_DPAR_DATA_TOL_QIJ

Absolute zero tolerance for elements in Q matrices.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-16

Groups: *Data check*

MSK_DPAR_DATA_TOL_X

Zero tolerance for constraints and variables i.e. if the distance between the lower and upper bound is less than this value, then the lower and upper bound is considered identical.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-8

Groups: *Data check*

MSK_DPAR_INTPNT_CO_TOL_DFEAS

Dual feasibility tolerance used by the conic interior-point optimizer.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion, Conic interior-point method*

MSK_DPAR_INTPNT_CO_TOL_INFEAS

Controls when the conic interior-point optimizer declares the model primal or dual infeasible. A small number means the optimizer gets more conservative about declaring the model infeasible.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-10

Groups: *Interior-point method, Termination criterion, Conic interior-point method*

MSK_DPAR_INTPNT_CO_TOL_MU_RED

Relative complementarity gap feasibility tolerance used by the conic interior-point optimizer.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion, Conic interior-point method*

MSK_DPAR_INTPNT_CO_TOL_NEAR_REL

If **MOSEK** cannot compute a solution that has the prescribed accuracy, then it will multiply the termination tolerances with value of this parameter. If the solution then satisfies the termination criteria, then the solution is denoted near optimal, near feasible and so forth.

Accepted Values: [1.0 ;+inf]

Default Value: 1000

Groups: *Interior-point method, Termination criterion, Conic interior-point method*

MSK_DPAR_INTPNT_CO_TOL_PFEAS

Primal feasibility tolerance used by the conic interior-point optimizer.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion, Conic interior-point method*

MSK_DPAR_INTPNT_CO_TOL_REL_GAP

Relative gap termination tolerance used by the conic interior-point optimizer.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-7

Groups: *Interior-point method, Termination criterion, Conic interior-point method*

MSK_DPAR_INTPNT_NL_MERIT_BAL

Controls if the complementarity and infeasibility is converging to zero at about equal rates.

Accepted Values: [0.0 ;0.99]

Default Value: 1.0e-4

Groups: *Interior-point method, Nonlinear convex method*

MSK_DPAR_INTPNT_NL_TOL_DFEAS

Dual feasibility tolerance used when a nonlinear model is solved.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion, Nonlinear convex method*

MSK_DPAR_INTPNT_NL_TOL_MU_RED

Relative complementarity gap tolerance.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-12

Groups: *Interior-point method, Termination criterion, Nonlinear convex method*

MSK_DPAR_INTPTNL_TOL_NEAR_REL

If the **MOSEK** nonlinear interior-point optimizer cannot compute a solution that has the prescribed accuracy, then it will multiply the termination tolerances with value of this parameter. If the solution then satisfies the termination criteria, then the solution is denoted near optimal, near feasible and so forth.

Accepted Values: [1.0 ;+inf]

Default Value: 1000.0

Groups: *Interior-point method, Termination criterion, Nonlinear convex method*

MSK_DPAR_INTPTNL_TOL_PFEAS

Primal feasibility tolerance used when a nonlinear model is solved.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion, Nonlinear convex method*

MSK_DPAR_INTPTNL_TOL_REL_GAP

Relative gap termination tolerance for nonlinear problems.

Accepted Values: [1.0e-14 ;+inf]

Default Value: 1.0e-6

Groups: *Termination criterion, Interior-point method, Nonlinear convex method*

MSK_DPAR_INTPTNL_TOL_REL_STEP

Relative step size to the boundary for general nonlinear optimization problems.

Accepted Values: [1.0e-4 ;0.9999999]

Default Value: 0.995

Groups: *Interior-point method, Nonlinear convex method*

MSK_DPAR_INTPTNL_QO_TOL_DFEAS

Dual feasibility tolerance used when the interior-point optimizer is applied to a quadratic optimization problem..

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPTNL_QO_TOL_INFEAS

Controls when the conic interior-point optimizer declares the model primal or dual infeasible. A small number means the optimizer gets more conservative about declaring the model infeasible.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-10

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPTNL_QO_TOL_MU_RED

Relative complementarity gap feasibility tolerance used when interior-point optimizer is applied to a quadratic optimization problem.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_QO_TOL_NEAR_REL

If **MOSEK** cannot compute a solution that has the prescribed accuracy, then it will multiply the termination tolerances with value of this parameter. If the solution then satisfies the termination criteria, then the solution is denoted near optimal, near feasible and so forth.

Accepted Values: [1.0 ;+inf]

Default Value: 1000

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_QO_TOL_PFEAS

Primal feasibility tolerance used when the interior-point optimizer is applied to a quadratic optimization problem.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_QO_TOL_REL_GAP

Relative gap termination tolerance used when the interior-point optimizer is applied to a quadratic optimization problem.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_TOL_DFEAS

Dual feasibility tolerance used for linear and quadratic optimization problems.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_TOL_DSAFE

Controls the initial dual starting point used by the interior-point optimizer. If the interior-point optimizer converges slowly and/or the constraint or variable bounds are very large, then it might be worthwhile to increase this value.

Accepted Values: [1.0e-4 ;+inf]

Default Value: 1.0

Groups: *Interior-point method*

MSK_DPAR_INTPNT_TOL_INFES

Controls when the optimizer declares the model primal or dual infeasible. A small number means the optimizer gets more conservative about declaring the model infeasible. A value of 0.0 means the optimizer must have an exact certificate of infeasibility and this is very unlikely to happen.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-10

Groups: *Interior-point method, Termination criterion, Nonlinear convex method*

MSK_DPAR_INTPNT_TOL_MU_RED

Relative complementarity gap tolerance.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-16

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_TOL_PATH

Controls how close the interior-point optimizer follows the central path. A large value of this parameter means the central is followed very closely. On numerical unstable problems it may be worthwhile to increase this parameter.

Accepted Values: [0.0 ;0.9999]

Default Value: 1.0e-8

Groups: *Interior-point method*

MSK_DPAR_INTPNT_TOL_PFEAS

Primal feasibility tolerance used for linear and quadratic optimization problems.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-8

Groups: *Interior-point method, Termination criterion*

MSK_DPAR_INTPNT_TOL_PSAFE

Controls the initial primal starting point used by the interior-point optimizer. If the interior-point optimizer converges slowly and/or the constraint or variable bounds are very large, then it may be worthwhile to increase this value.

Accepted Values: [1.0e-4 ;+inf]

Default Value: 1.0

Groups: *Interior-point method*

MSK_DPAR_INTPNT_TOL_REL_GAP

Relative gap termination tolerance.

Accepted Values: [1.0e-14 ;+inf]

Default Value: 1.0e-8

Groups: *Termination criterion, Interior-point method*

MSK_DPAR_INTPNT_TOL_REL_STEP

Relative step size to the boundary for linear and quadratic optimization problems.

Accepted Values: [1.0e-4 ;0.999999]

Default Value: 0.9999

Groups: *Interior-point method*

MSK_DPAR_INTPNT_TOL_STEP_SIZE

If the step size falls below the value of this parameter, then the interior-point optimizer assumes that it is stalled. In other words the interior-point optimizer does not make any progress and therefore it is better stop.

Accepted Values: [0.0 ;1.0]

Default Value: 1.0e-6

Groups: *Interior-point method*

MSK_DPAR_LOWER_OBJ_CUT

If either a primal or dual feasible solution is found proving that the optimal objective value is outside, the interval [*MSK_DPAR_LOWER_OBJ_CUT*, *MSK_DPAR_UPPER_OBJ_CUT*], then **MOSEK** is terminated.

Accepted Values: [-inf ;+inf]

Default Value: -1.0e30

Groups: *Termination criterion*

MSK_DPAR_LOWER_OBJ_CUT_FINITE_TRH

If the lower objective cut is less than the value of this parameter value, then the lower objective cut i.e. *MSK_DPAR_LOWER_OBJ_CUT* is treated as $-\infty$.

Accepted Values: $[-\text{inf}; +\text{inf}]$

Default Value: $-0.5\text{e}30$

Groups: *Termination criterion*

MSK_DPAR_MIO_DISABLE_TERM_TIME

This parameter specifies the number of seconds n during which the termination criteria governed by

- *MSK_IPAR_MIO_MAX_NUM_RELAXS*
- *MSK_IPAR_MIO_MAX_NUM_BRANCHES*
- *MSK_DPAR_MIO_NEAR_TOL_ABS_GAP*
- *MSK_DPAR_MIO_NEAR_TOL_REL_GAP*

is disabled since the beginning of the optimization.

A negative value is identical to infinity i.e. the termination criteria are never checked.

Accepted Values: $[-\text{inf}; +\text{inf}]$

Default Value: -1.0

Groups: *Mixed-integer optimization, Termination criterion*

MSK_DPAR_MIO_MAX_TIME

This parameter limits the maximum time spent by the mixed-integer optimizer. A negative number means infinity.

Accepted Values: $[-\text{inf}; +\text{inf}]$

Default Value: -1.0

Groups: *Mixed-integer optimization, Termination criterion*

MSK_DPAR_MIO_NEAR_TOL_ABS_GAP

Relaxed absolute optimality tolerance employed by the mixed-integer optimizer. This termination criteria is delayed. See *MSK_DPAR_MIO_DISABLE_TERM_TIME* for details.

Accepted Values: $[0.0; +\text{inf}]$

Default Value: 0.0

Groups: *Mixed-integer optimization*

MSK_DPAR_MIO_NEAR_TOL_REL_GAP

The mixed-integer optimizer is terminated when this tolerance is satisfied. This termination criteria is delayed. See *MSK_DPAR_MIO_DISABLE_TERM_TIME* for details.

Accepted Values: $[0.0; +\text{inf}]$

Default Value: $1.0\text{e-}3$

Groups: *Mixed-integer optimization, Termination criterion*

MSK_DPAR_MIO_REL_GAP_CONST

This value is used to compute the relative gap for the solution to an integer optimization problem.

Accepted Values: $[1.0\text{e-}15; +\text{inf}]$

Default Value: $1.0\text{e-}10$

Groups: *Mixed-integer optimization, Termination criterion*

MSK_DPAR_MIO_TOL_ABS_GAP

Absolute optimality tolerance employed by the mixed-integer optimizer.

Accepted Values: [0.0 ;+inf]

Default Value: 0.0

Groups: *Mixed-integer optimization*

MSK_DPAR_MIO_TOL_ABS_RELAX_INT

Absolute relaxation tolerance of the integer constraints. I.e. $\min(|x| - \lfloor x \rfloor, \lceil x \rceil - |x|)$ is less than the tolerance then the integer restrictions assumed to be satisfied.

Accepted Values: [1e-9 ;+inf]

Default Value: 1.0e-5

Groups: *Mixed-integer optimization*

MSK_DPAR_MIO_TOL_FEAS

Feasibility tolerance for mixed integer solver.

Accepted Values: [1e-9 ;1e-3]

Default Value: 1.0e-6

Groups: *Mixed-integer optimization*

MSK_DPAR_MIO_TOL_REL_DUAL_BOUND_IMPROVEMENT

If the relative improvement of the dual bound is smaller than this value, the solver will terminate the root cut generation. A value of 0.0 means that the value is selected automatically.

Accepted Values: [0.0 ;1.0]

Default Value: 0.0

Groups: *Mixed-integer optimization*

MSK_DPAR_MIO_TOL_REL_GAP

Relative optimality tolerance employed by the mixed-integer optimizer.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-4

Groups: *Mixed-integer optimization, Termination criterion*

MSK_DPAR_OPTIMIZER_MAX_TIME

Maximum amount of time the optimizer is allowed to spent on the optimization. A negative number means infinity.

Accepted Values: [-inf ;+inf]

Default Value: -1.0

Groups: *Termination criterion*

MSK_DPAR_PREOLVE_TOL_ABS_LINDEP

Absolute tolerance employed by the linear dependency checker.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-6

Groups: *Presolve*

MSK_DPAR_PREOLVE_TOL_AIJ

Absolute zero tolerance employed for a_{ij} in the presolve.

Accepted Values: [1.0e-15 ;+inf]

Default Value: 1.0e-12

Groups: *Presolve*

MSK_DPAR_PREOLVE_TOL_REL_LINDEP

Relative tolerance employed by the linear dependency checker.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-10

Groups: *Presolve*

MSK_DPAR_PREOLVE_TOL_S

Absolute zero tolerance employed for s_i in the presolve.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-8

Groups: *Presolve*

MSK_DPAR_PREOLVE_TOL_X

Absolute zero tolerance employed for x_j in the presolve.

Accepted Values: [0.0 ;+inf]

Default Value: 1.0e-8

Groups: *Presolve*

MSK_DPAR_QCQO_REFORMULATE_REL_DROP_TOL

This parameter determines when columns are dropped in incomplete Cholesky factorization during reformulation of quadratic problems.

Accepted Values: [0 ;+inf]

Default Value: 1e-15

Groups: *Interior-point method*

MSK_DPAR_SEMIDEFINITE_TOL_APPROX

Tolerance to define a matrix to be positive semidefinite.

Accepted Values: [1.0e-15 ;+inf]

Default Value: 1.0e-10

Groups: *Data check*

MSK_DPAR_SIMPLEX_ABS_TOL_PIV

Absolute pivot tolerance employed by the simplex optimizers.

Accepted Values: [1.0e-12 ;+inf]

Default Value: 1.0e-7

Groups: *Simplex optimizer*

MSK_DPAR_SIM_LU_TOL_REL_PIV

Relative pivot tolerance employed when computing the LU factorization of the basis in the simplex optimizers and in the basis identification procedure.

A value closer to 1.0 generally improves numerical stability but typically also implies an increase in the computational work.

Accepted Values: [1.0e-6 ;0.999999]

Default Value: 0.01

Groups: *Basis identification, Simplex optimizer*

MSK_DPAR_UPPER_OBJ_CUT

If either a primal or dual feasible solution is found proving that the optimal objective value is outside, the interval [*MSK_DPAR_LOWER_OBJ_CUT* , *MSK_DPAR_UPPER_OBJ_CUT*], then **MOSEK** is terminated.

Accepted Values: `[-inf ;+inf]`

Default Value: `1.0e30`

Groups: *Termination criterion*

MSK_DPAR_UPPER_OBJ_CUT_FINITE_TRH

If the upper objective cut is greater than the value of this parameter, then the upper objective cut *MSK_DPAR_UPPER_OBJ_CUT* is treated as ∞ .

Accepted Values: `[-inf ;+inf]`

Default Value: `0.5e30`

Groups: *Termination criterion*

Integer Parameters

MSK_IPAR_ANA_SOL_BASIS

Controls whether the basis matrix is analyzed in solution analyzer.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Analysis*

MSK_IPAR_ANA_SOL_PRINT_VIOLATED

Controls whether a list of violated constraints is printed when calling *task.analyzesolution*.

All constraints violated by more than the value set by the parameter *MSK_DPAR_ANA_SOL_INFEAS_TOL* will be printed.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Analysis*

MSK_IPAR_AUTO_SORT_A_BEFORE_OPT

Controls whether the elements in each column of *A* are sorted before an optimization is performed. This is not required but makes the optimization more deterministic.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Debugging*

MSK_IPAR_AUTO_UPDATE_SOL_INFO

Controls whether the solution information items are automatically updated after an optimization is performed.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Optimization system*

MSK_IPAR_BASIS_SOLVE_USE_PLUS_ONE

If a slack variable is in the basis, then the corresponding column in the basis is a unit vector with -1 in the right position. However, if this parameter is set to *MSK_ON*, -1 is replaced by 1.

This has significance for the results returned by the *task.solvewithbasis* function.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Simplex optimizer*

MSK_IPAR_BI_CLEAN_OPTIMIZER

Controls which simplex optimizer is used in the clean-up phase.

Accepted Values: *MSKoptimizertypee*

Default Value: *MSK_OPTIMIZER_FREE*

Groups: *Basis identification, Overall solver*

MSK_IPAR_BI_IGNORE_MAX_ITER

If the parameter *MSK_IPAR_INTPNT_BASIS* has the value *MSK_BI_NO_ERROR* and the interior-point optimizer has terminated due to maximum number of iterations, then basis identification is performed if this parameter has the value *MSK_ON*.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Interior-point method, Basis identification*

MSK_IPAR_BI_IGNORE_NUM_ERROR

If the parameter *MSK_IPAR_INTPNT_BASIS* has the value *MSK_BI_NO_ERROR* and the interior-point optimizer has terminated due to a numerical problem, then basis identification is performed if this parameter has the value *MSK_ON*.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Interior-point method, Basis identification*

MSK_IPAR_BI_MAX_ITERATIONS

Controls the maximum number of simplex iterations allowed to optimize a basis after the basis identification.

Accepted Values: *[0 ;+inf]*

Default Value: *1000000*

Groups: *Basis identification, Termination criterion*

MSK_IPAR_CACHE_LICENSE

Specifies if the license is kept checked out for the lifetime of the mosek environment (*MSK_ON*) or returned to the server immediately after the optimization (*MSK_OFF*).

By default the license is checked out for the lifetime of the **MOSEK** environment by the first call to *task.optimize*.

Check-in and check-out of licenses have an overhead. Frequent communication with the license server should be avoided.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *License manager*

MSK_IPAR_CHECK_CONVEXITY

Specify the level of convexity check on quadratic problems

Accepted Values: *MSKcheckconvexitytypee*

Default Value: *MSK_CHECK_CONVEXITY_FULL*

Groups: *Data check, Nonlinear convex method*

MSK_IPAR_COMPRESS_STATFILE

Control compression of stat files.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

MSK_IPAR_INFEAS_GENERIC_NAMES

Controls whether generic names are used when an infeasible subproblem is created.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Infeasibility report*

MSK_IPAR_INFEAS_PREFER_PRIMAL

If both certificates of primal and dual infeasibility are supplied then only the primal is used when this option is turned on.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Overall solver*

MSK_IPAR_INFEAS_REPORT_AUTO

Controls whether an infeasibility report is automatically produced after the optimization if the problem is primal or dual infeasible.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_INFEAS_REPORT_LEVEL

Controls the amount of information presented in an infeasibility report. Higher values imply more information.

Accepted Values: *[0 ;+inf]*

Default Value: *1*

Groups: *Infeasibility report, Output information*

MSK_IPAR_INTPNT_BASIS

Controls whether the interior-point optimizer also computes an optimal basis.

Accepted Values: *MSK_basindtypee*

Default Value: *MSK_BI_ALWAYS*

Groups: *Interior-point method, Basis identification*

MSK_IPAR_INTPNT_DIFF_STEP

Controls whether different step sizes are allowed in the primal and dual space.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Interior-point method*

MSK_IPAR_INTPNT_HOTSTART

Currently not in use.

Accepted Values: *MSK_intpnt_hotstarte*

Default Value: *MSK_INTPNT_HOTSTART_NONE*

Groups: *Interior-point method*

MSK_IPAR_INTPNT_MAX_ITERATIONS

Controls the maximum number of iterations allowed in the interior-point optimizer.

Accepted Values: *[0 ;+inf]*

Default Value: *400*

Groups: *Interior-point method, Termination criterion*

MSK_IPAR_INTPNT_MAX_NUM_COR

Controls the maximum number of correctors allowed by the multiple corrector procedure. A negative value means that **MOSEK** is making the choice.

Accepted Values: `[-1 ;+inf]`

Default Value: `-1`

Groups: *Interior-point method*

MSK_IPAR_INTPNT_MAX_NUM_REFINEMENT_STEPS

Maximum number of steps to be used by the iterative refinement of the search direction. A negative value implies that the optimizer chooses the maximum number of iterative refinement steps.

Accepted Values: `[-inf ;+inf]`

Default Value: `-1`

Groups: *Interior-point method*

MSK_IPAR_INTPNT_MULTI_THREAD

Controls whether the interior-point optimizers are allowed to employ multiple threads if more threads is available.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Optimization system*

MSK_IPAR_INTPNT_OFF_COL_TRH

Controls how many offending columns are detected in the Jacobian of the constraint matrix.

0	no detection
1	aggressive detection
> 1	higher values mean less aggressive detection

Accepted Values: `[0 ;+inf]`

Default Value: `40`

Groups: *Interior-point method*

MSK_IPAR_INTPNT_ORDER_METHOD

Controls the ordering strategy used by the interior-point optimizer when factorizing the Newton equation system.

Accepted Values: *MSKorderingtypee*

Default Value: *MSK_ORDER_METHOD_FREE*

Groups: *Interior-point method*

MSK_IPAR_INTPNT_REGULARIZATION_USE

Controls whether regularization is allowed.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Interior-point method*

MSK_IPAR_INTPNT_SCALING

Controls how the problem is scaled before the interior-point optimizer is used.

Accepted Values: *MSKscalingtypee*

Default Value: *MSK_SCALING_FREE*

Groups: *Interior-point method*

MSK_IPAR_INTPNT_SOLVE_FORM

Controls whether the primal or the dual problem is solved.

Accepted Values: *MSKsolveforme*

Default Value: *MSK_SOLVE_FREE*

Groups: *Interior-point method*

MSK_IPAR_INTPNT_STARTING_POINT

Starting point used by the interior-point optimizer.

Accepted Values: *MSKstartpointtypee*

Default Value: *MSK_STARTING_POINT_FREE*

Groups: *Interior-point method*

MSK_IPAR_LICENSE_DEBUG

This option is used to turn on debugging of the license manager.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *License manager*

MSK_IPAR_LICENSE_PAUSE_TIME

If *MSK_IPAR_LICENSE_WAIT* = *MSK_ON* and no license is available, then **MOSEK** sleeps a number of milliseconds between each check of whether a license has become free.

Accepted Values: [0 ;1000000]

Default Value: 100

Groups: *License manager*

MSK_IPAR_LICENSE_SUPPRESS_EXPIRE_WRNS

Controls whether license features expire warnings are suppressed.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *License manager, Output information*

MSK_IPAR_LICENSE_TRH_EXPIRY_WRN

If a license feature expires in a numbers days less than the value of this parameter then a warning will be issued.

Accepted Values: [0 ;+inf]

Default Value: 7

MSK_IPAR_LICENSE_WAIT

If all licenses are in **MOSEK** returns with an error code. However, by turning on this parameter **MOSEK** will wait for an available license.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Overall solver, Optimization system, License manager*

MSK_IPAR_LOG

Controls the amount of log information. The value 0 implies that all log information is suppressed. A higher level implies that more information is logged.

Please note that if a task is employed to solve a sequence of optimization problems the value of this parameter is reduced by the value of *MSK_IPAR_LOG_CUT_SECOND_OPT* for the second and any subsequent optimizations.

Accepted Values: [0 ;+inf]

Default Value: 10

Groups: *Output information, Logging*

MSK_IPAR_LOG_ANA_PRO

Controls amount of output from the problem analyzer.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Analysis, Logging*

MSK_IPAR_LOG_BI

Controls the amount of output printed by the basis identification procedure. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 4

Groups: *Basis identification, Output information, Logging*

MSK_IPAR_LOG_BI_FREQ

Controls how frequent the optimizer outputs information about the basis identification and how frequent the user-defined call-back function is called.

Accepted Values: [0 ;+inf]

Default Value: 2500

Groups: *Basis identification, Output information, Logging*

MSK_IPAR_LOG_CHECK_CONVEXITY

Controls logging in convexity check on quadratic problems. Set to a positive value to turn logging on. If a quadratic coefficient matrix is found to violate the requirement of PSD (NSD) then a list of negative (positive) pivot elements is printed. The absolute value of the pivot elements is also shown.

Accepted Values: [0 ;+inf]

Default Value: 0

Groups: *Data check, Nonlinear convex method*

MSK_IPAR_LOG_CUT_SECOND_OPT

If a task is employed to solve a sequence of optimization problems, then the value of the log levels is reduced by the value of this parameter. E.g *MSK_IPAR_LOG* and *MSK_IPAR_LOG_SIM* are reduced by the value of this parameter for the second and any subsequent optimizations.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_EXPAND

Controls the amount of logging when a data item such as the maximum number constraints is expanded.

Accepted Values: [0 ;+inf]

Default Value: 0

Groups: *Output information, Logging*

MSK_IPAR_LOG_FACTOR

If turned on, then the factor log lines are added to the log.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_FEAS_REPAIR

Controls the amount of output printed when performing feasibility repair. A value higher than one means extensive logging.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_FILE

If turned on, then some log info is printed when a file is written or read.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Data input/output, Output information, Logging*

MSK_IPAR_LOG_HEAD

If turned on, then a header line is added to the log.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_INFEAS_ANA

Controls amount of output printed by the infeasibility analyzer procedures. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Infeasibility report, Output information, Logging*

MSK_IPAR_LOG_INTPNT

Controls amount of output printed by the interior-point optimizer. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 4

Groups: *Interior-point method, Output information, Logging*

MSK_IPAR_LOG_MIO

Controls the log level for the mixed-integer optimizer. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 4

Groups: *Mixed-integer optimization, Output information, Logging*

MSK_IPAR_LOG_MIO_FREQ

Controls how frequent the mixed-integer optimizer prints the log line. It will print line every time *MSK_IPAR_LOG_MIO_FREQ* relaxations have been solved.

Accepted Values: [-inf ;+inf]

Default Value: 10

Groups: *Mixed-integer optimization, Output information, Logging*

MSK_IPAR_LOG_OPTIMIZER

Controls the amount of general optimizer information that is logged.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_ORDER

If turned on, then factor lines are added to the log.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_PRESOLVE

Controls amount of output printed by the presolve procedure. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Interior-point method, Logging*

MSK_IPAR_LOG_RESPONSE

Controls amount of output printed when response codes are reported. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 0

Groups: *Output information, Logging*

MSK_IPAR_LOG_SENSITIVITY

Controls the amount of logging during the sensitivity analysis.

0.Means no logging information is produced.

1.Timing information is printed.

2.Sensitivity results are printed.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Output information, Logging*

MSK_IPAR_LOG_SENSITIVITY_OPT

Controls the amount of logging from the optimizers employed during the sensitivity analysis. 0 means no logging information is produced.

Accepted Values: [0 ;+inf]

Default Value: 0

Groups: *Output information, Logging*

MSK_IPAR_LOG_SIM

Controls amount of output printed by the simplex optimizer. A higher level implies that more information is logged.

Accepted Values: [0 ;+inf]

Default Value: 4

Groups: *Simplex optimizer, Output information, Logging*

MSK_IPAR_LOG_SIM_FREQ

Controls how frequent the simplex optimizer outputs information about the optimization and how frequent the user-defined call-back function is called.

Accepted Values: [0 ;+inf]

Default Value: 1000

Groups: *Simplex optimizer, Output information, Logging*

MSK_IPAR_LOG_SIM_MINOR

Currently not in use.

Accepted Values: [0 ;+inf]

Default Value: 1

Groups: *Simplex optimizer, Output information*

MSK_IPAR_LOG_STORAGE

When turned on, **MOSEK** prints messages regarding the storage usage and allocation.

Accepted Values: [0 ;+inf]

Default Value: 0

Groups: *Output information, Optimization system, Logging*

MSK_IPAR_MAX_NUM_WARNINGS

Each warning is shown a limit number times controlled by this parameter. A negative value is identical to infinite number of times.

Accepted Values: [-inf ;+inf]

Default Value: 10

Groups: *Output information*

MSK_IPAR_MIO_BRANCH_DIR

Controls whether the mixed-integer optimizer is branching up or down by default.

Accepted Values: *MSKbranchdire*

Default Value: *MSK_BRANCH_DIR_FREE*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CONSTRUCT_SOL

If set to *MSK_ON* and all integer variables have been given a value for which a feasible mixed integer solution exists, then **MOSEK** generates an initial solution to the mixed integer problem by fixing all integer values and solving the remaining problem.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CUT_CLIQUE

Controls whether clique cuts should be generated.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CUT_CMIR

Controls whether mixed integer rounding cuts should be generated.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CUT_GMI
Controls whether GMI cuts should be generated.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CUT_IMPLIED_BOUND
Controls whether implied bound cuts should be generated.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CUT_KNAPSACK_COVER
Controls whether knapsack cover cuts should be generated.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_CUT_SELECTION_LEVEL
Controls how aggressively generated cuts are selected to be included in the relaxation.

- 1. The optimizer chooses the level of cut selection
 - 0. Generated cuts less likely to be added to the relaxation
 - 1. Cuts are more aggressively selected to be included in the relaxation

Accepted Values: $[-1 ; +1]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_HEURISTIC_LEVEL
Controls the heuristic employed by the mixed-integer optimizer to locate an initial good integer feasible solution. A value of zero means the heuristic is not used at all. A larger value than 0 means that a gradually more sophisticated heuristic is used which is computationally more expensive. A negative value implies that the optimizer chooses the heuristic. Normally a value around 3 to 5 should be optimal.

Accepted Values: $[-inf ; +inf]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_MAX_NUM_BRANCHES
Maximum number of branches allowed during the branch and bound search. A negative value means infinite.

Accepted Values: $[-inf ; +inf]$

Default Value: -1

Groups: *Mixed-integer optimization, Termination criterion*

MSK_IPAR_MIO_MAX_NUM_RELAXS
Maximum number of relaxations allowed during the branch and bound search. A negative value means infinite.

Accepted Values: $[-inf ; +inf]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_MAX_NUM_SOLUTIONS

The mixed-integer optimizer can be terminated after a certain number of different feasible solutions has been located. If this parameter has the value $n > 0$, then the mixed-integer optimizer will be terminated when n feasible solutions have been located.

Accepted Values: `[-inf ; +inf]`

Default Value: -1

Groups: *Mixed-integer optimization, Termination criterion*

MSK_IPAR_MIO_MODE

Controls whether the optimizer includes the integer restrictions when solving a (mixed) integer optimization problem.

Accepted Values: *MSKmiomodee*

Default Value: *MSK_MIO_MODE_SATISFIED*

Groups: *Overall solver*

MSK_IPAR_MIO_MT_USER_CB

If true user callbacks are called from each thread used by this optimizer. If false the user callback is only called from a single thread.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Optimization system*

MSK_IPAR_MIO_NODE_OPTIMIZER

Controls which optimizer is employed at the non-root nodes in the mixed-integer optimizer.

Accepted Values: *MSKoptimizertypee*

Default Value: *MSK_OPTIMIZER_FREE*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_NODE_SELECTION

Controls the node selection strategy employed by the mixed-integer optimizer.

Accepted Values: *MSKmionodeseltypee*

Default Value: *MSK_MIO_NODE_SELECTION_FREE*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_PERSPECTIVE_REFORMULATE

Enables or disables perspective reformulation in presolve.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_PROBING_LEVEL

Controls the amount of probing employed by the mixed-integer optimizer in presolve.

-1. The optimizer chooses the level of probing employed

0. Probing is disabled

1. A low amount of probing is employed

2. A medium amount of probing is employed

3. A high amount of probing is employed

Accepted Values: $[-\text{inf} ; +\text{inf}]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_RINS_MAX_NODES

Controls the maximum number of nodes allowed in each call to the RINS heuristic. The default value of -1 means that the value is determined automatically. A value of zero turns off the heuristic.

Accepted Values: $[-1 ; +\text{inf}]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_ROOT_OPTIMIZER

Controls which optimizer is employed at the root node in the mixed-integer optimizer.

Accepted Values: *MSKoptimizertypee*

Default Value: *MSK_OPTIMIZER_FREE*

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_ROOT_REPEAT_PREOLVE_LEVEL

Controls whether presolve can be repeated at root node.

- -1 The optimizer chooses whether presolve is repeated
- 0 Never repeat presolve
- 1 Always repeat presolve

Accepted Values: $[-1 ; 1]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MIO_VB_DETECTION_LEVEL

Controls how much effort is put into detecting variable bounds.

- 1. The optimizer chooses
 - 0.No variable bounds are detected
 - 1.Only detect variable bounds that are directly represented in the problem
 - 2.Detect variable bounds in probing

Accepted Values: $[-1 ; +2]$

Default Value: -1

Groups: *Mixed-integer optimization*

MSK_IPAR_MT_SPINCOUNT

Set the number of iterations to spin before sleeping.

Accepted Values: $[0 ; 1000000000]$

Default Value: 0

Groups: *Optimization system*

MSK_IPAR_NUM_THREADS

Controls the number of threads employed by the optimizer. If set to 0 the number of threads used will be equal to the number of cores detected on the machine.

Accepted Values: $[0 ; +\text{inf}]$

Default Value: 0

Groups: *Optimization system*

MSK_IPAR_OPF_MAX_TERMS_PER_LINE

The maximum number of terms (linear and quadratic) per line when an OPF file is written.

Accepted Values: [0 ;+inf]

Default Value: 5

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_HEADER

Write a text header with date and **MOSEK** version in an OPF file.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_HINTS

Write a hint section with problem dimensions in the beginning of an OPF file.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_PARAMETERS

Write a parameter section in an OPF file.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_PROBLEM

Write objective, constraints, bounds etc. to an OPF file.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_SOLUTIONS

Enable inclusion of solutions in the OPF files.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_SOL_BAS

If *MSK_IPAR_OPF_WRITE_SOLUTIONS* is *MSK_ON* and a basic solution is defined, include the basic solution in OPF files.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_SOL_ITG

If *MSK_IPAR_OPF_WRITE_SOLUTIONS* is *MSK_ON* and an integer solution is defined, write the integer solution in OPF files.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_OPF_WRITE_SOL_ITR

If *MSK_IPAR_OPF_WRITE_SOLUTIONS* is *MSK_ON* and an interior solution is defined, write the interior solution in OPF files.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_OPTIMIZER

The parameter controls which optimizer is used to optimize the task.

Accepted Values: *MSKoptimizertyp*

Default Value: *MSK_OPTIMIZER_FREE*

Groups: *Overall solver*

MSK_IPAR_PARAM_READ_CASE_NAME

If turned on, then names in the parameter file are case sensitive.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_PARAM_READ_IGN_ERROR

If turned on, then errors in parameter settings is ignored.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_PREOLVE_ELIMINATOR_MAX_FILL

Controls the maximum amount of fill-in that can be created by one pivot in the elimination phase of the presolve. A negative value means the parameter value is selected automatically.

Accepted Values: $[-inf ; +inf]$

Default Value: -1

Groups: *Presolve*

MSK_IPAR_PREOLVE_ELIMINATOR_MAX_NUM_TRIES

Control the maximum number of times the eliminator is tried.

Accepted Values: $[-inf ; +inf]$

Default Value: -1

Groups: *Presolve*

MSK_IPAR_PREOLVE_LEVEL

Currently not used.

Accepted Values: $[-inf ; +inf]$

Default Value: -1

Groups: *Overall solver, Presolve*

MSK_IPAR_PREOLVE_LINDEP_ABS_WORK_TRH

The linear dependency check is potentially computationally expensive.

Accepted Values: $[-inf ; +inf]$

Default Value: 100

Groups: *Presolve*

MSK_IPAR_PRESOLVE_LINDEP_REL_WORK_TRH

The linear dependency check is potentially computationally expensive.

Accepted Values: `[-inf ;+inf]`

Default Value: `100`

Groups: *Presolve*

MSK_IPAR_PRESOLVE_LINDEP_USE

Controls whether the linear constraints are checked for linear dependencies.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Presolve*

MSK_IPAR_PRESOLVE_MAX_NUM_REDUCTIONS

Controls the maximum number of reductions performed by the presolve. The value of the parameter is normally only changed in connection with debugging. A negative value implies that an infinite number of reductions are allowed.

Accepted Values: `[-inf ;+inf]`

Default Value: `-1`

MSK_IPAR_PRESOLVE_USE

Controls whether the presolve is applied to a problem before it is optimized.

Accepted Values: *MSKpresolvemodee*

Default Value: *MSK_PRESOLVE_MODE_FREE*

Groups: *Overall solver, Presolve*

MSK_IPAR_PRIMAL_REPAIR_OPTIMIZER

Controls which optimizer that is used to find the optimal repair.

Accepted Values: *MSKoptimizertypee*

Default Value: *MSK_OPTIMIZER_FREE*

Groups: *Overall solver*

MSK_IPAR_READ_DATA_COMPRESSED

If this option is turned on, it is assumed that the data file is compressed.

Accepted Values: *MSKcompressstypee*

Default Value: *MSK_COMPRESS_FREE*

Groups: *Data input/output*

MSK_IPAR_READ_DATA_FORMAT

Format of the data file to be read.

Accepted Values: *MSKdataformate*

Default Value: *MSK_DATA_FORMAT_EXTENSION*

Groups: *Data input/output*

MSK_IPAR_READ_DEBUG

Turns on additional debugging information when reading files.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_READ_KEEP_FREE_CON

Controls whether the free constraints are included in the problem.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_READ_LP_DROP_NEW_VARS_IN_BOU

If this option is turned on, **MOSEK** will drop variables that are defined for the first time in the bounds section.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_READ_LP_QUOTED_NAMES

If a name is in quotes when reading an LP file, the quotes will be removed.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_READ_MPS_FORMAT

Controls how strictly the MPS file reader interprets the MPS format.

Accepted Values: *MSKmpsformate*

Default Value: *MSK_MPS_FORMAT_FREE*

Groups: *Data input/output*

MSK_IPAR_READ_MPS_WIDTH

Controls the maximal number of characters allowed in one line of the MPS file.

Accepted Values: *[80 ;+inf]*

Default Value: *1024*

Groups: *Data input/output*

MSK_IPAR_READ_TASK_IGNORE_PARAM

Controls whether **MOSEK** should ignore the parameter setting defined in the task file and use the default parameter setting instead.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_SENSITIVITY_ALL

If set to *MSK_ON*, then *task.sensitivityreport* analyzes all bounds and variables instead of reading a specification from the file.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Overall solver*

MSK_IPAR_SENSITIVITY_OPTIMIZER

Controls which optimizer is used for optimal partition sensitivity analysis.

Accepted Values: *MSKoptimizertypee*

Default Value: *MSK_OPTIMIZER_FREE_SIMPLEX*

Groups: *Overall solver, Simplex optimizer*

MSK_IPAR_SENSITIVITY_TYPE

Controls which type of sensitivity analysis is to be performed.

Accepted Values: *MSKsensitivitytypee*

Default Value: *MSK_SENSITIVITY_TYPE_BASIS*

Groups: *Overall solver*

MSK_IPAR_SIM_BASIS_FACTOR_USE

Controls whether a (LU) factorization of the basis is used in a hot-start. Forcing a refactorization sometimes improves the stability of the simplex optimizers, but in most cases there is a performance penalty.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_DEGEN

Controls how aggressively degeneration is handled.

Accepted Values: *MSKsimdegene*

Default Value: *MSK_SIM_DEGEN_FREE*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_DUAL_CRASH

Controls whether crashing is performed in the dual simplex optimizer.

If this parameter is set to x , then a crash will be performed if a basis consists of more than $(100 - x) \bmod f_v$ entries, where f_v is the number of fixed variables.

Accepted Values: $[0 ; +\infty]$

Default Value: 90

Groups: *Dual simplex optimizer*

MSK_IPAR_SIM_DUAL_PHASEONE_METHOD

An experimental feature.

Accepted Values: $[0 ; 10]$

Default Value: 0

Groups: *Simplex optimizer*

MSK_IPAR_SIM_DUAL_RESTRICT_SELECTION

The dual simplex optimizer can use a so-called restricted selection/pricing strategy to choose the outgoing variable. Hence, if restricted selection is applied, then the dual simplex optimizer first choose a subset of all the potential outgoing variables. Next, for some time it will choose the outgoing variable only among the subset. From time to time the subset is redefined.

A larger value of this parameter implies that the optimizer will be more aggressive in its restriction strategy, i.e. a value of 0 implies that the restriction strategy is not applied at all.

Accepted Values: $[0 ; 100]$

Default Value: 50

Groups: *Dual simplex optimizer*

MSK_IPAR_SIM_DUAL_SELECTION

Controls the choice of the incoming variable, known as the selection strategy, in the dual simplex optimizer.

Accepted Values: *MSKsimseltypee*

Default Value: *MSK_SIM_SELECTION_FREE*

- Groups: *Dual simplex optimizer*
- MSK_IPAR_SIM_EXPLOIT_DUPVEC**
Controls if the simplex optimizers are allowed to exploit duplicated columns.
- Accepted Values: *MSKsimdupvece*
- Default Value: *MSK_SIM_EXPLOIT_DUPVEC_OFF*
- Groups: *Simplex optimizer*
- MSK_IPAR_SIM_HOTSTART**
Controls the type of hot-start that the simplex optimizer perform.
- Accepted Values: *MSKsimhotstarte*
- Default Value: *MSK_SIM_HOTSTART_FREE*
- Groups: *Simplex optimizer*
- MSK_IPAR_SIM_HOTSTART_LU**
Determines if the simplex optimizer should exploit the initial factorization.
- Accepted Values: *MSKonoffkeye*
- Default Value: *MSK_ON*
- MSK_IPAR_SIM_INTEGER**
An experimental feature.
- Accepted Values: [0 ;10]
- Default Value: 0
- Groups: *Simplex optimizer*
- MSK_IPAR_SIM_MAX_ITERATIONS**
Maximum number of iterations that can be used by a simplex optimizer.
- Accepted Values: [0 ;+inf]
- Default Value: 10000000
- Groups: *Simplex optimizer, Termination criterion*
- MSK_IPAR_SIM_MAX_NUM_SETBACKS**
Controls how many set-backs are allowed within a simplex optimizer. A set-back is an event where the optimizer moves in the wrong direction. This is impossible in theory but may happen due to numerical problems.
- Accepted Values: [0 ;+inf]
- Default Value: 250
- Groups: *Simplex optimizer*
- MSK_IPAR_SIM_NON_SINGULAR**
Controls if the simplex optimizer ensures a non-singular basis, if possible.
- Accepted Values: *MSKonoffkeye*
- Default Value: *MSK_ON*
- Groups: *Simplex optimizer*
- MSK_IPAR_SIM_PRIMAL_CRASH**
Controls whether crashing is performed in the primal simplex optimizer.
- In general, if a basis consists of more than (100-this parameter value)% fixed variables, then a crash will be performed.
- Accepted Values: [0 ;+inf]
- Default Value: 90

Groups: *Primal simplex optimizer*

MSK_IPAR_SIM_PRIMAL_PHASEONE_METHOD

An experimental feature.

Accepted Values: [0 ;10]

Default Value: 0

Groups: *Simplex optimizer*

MSK_IPAR_SIM_PRIMAL_RESTRICT_SELECTION

The primal simplex optimizer can use a so-called restricted selection/pricing strategy to chooses the outgoing variable. Hence, if restricted selection is applied, then the primal simplex optimizer first choose a subset of all the potential incoming variables. Next, for some time it will choose the incoming variable only among the subset. From time to time the subset is redefined.

A larger value of this parameter implies that the optimizer will be more aggressive in its restriction strategy, i.e. a value of 0 implies that the restriction strategy is not applied at all.

Accepted Values: [0 ;100]

Default Value: 50

Groups: *Primal simplex optimizer*

MSK_IPAR_SIM_PRIMAL_SELECTION

Controls the choice of the incoming variable, known as the selection strategy, in the primal simplex optimizer.

Accepted Values: *MSKsimseltypee*

Default Value: *MSK_SIM_SELECTION_FREE*

Groups: *Primal simplex optimizer*

MSK_IPAR_SIM_REFACTOR_FREQ

Controls how frequent the basis is refactorized. The value 0 means that the optimizer determines the best point of refactorization.

It is strongly recommended NOT to change this parameter.

Accepted Values: [0 ;+inf]

Default Value: 0

Groups: *Simplex optimizer*

MSK_IPAR_SIM_REFORMULATION

Controls if the simplex optimizers are allowed to reformulate the problem.

Accepted Values: *MSKsimreforme*

Default Value: *MSK_SIM_REFORMULATION_OFF*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_SAVE_LU

Controls if the LU factorization stored should be replaced with the LU factorization corresponding to the initial basis.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_SCALING

Controls how much effort is used in scaling the problem before a simplex optimizer is used.

Accepted Values: *MSKscalingtypee*

Default Value: *MSK_SCALING_FREE*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_SCALING_METHOD

Controls how the problem is scaled before a simplex optimizer is used.

Accepted Values: *MSKscalingmethode*

Default Value: *MSK_SCALING_METHOD_POW2*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_SOLVE_FORM

Controls whether the primal or the dual problem is solved by the primal-/dual-simplex optimizer.

Accepted Values: *MSKsolveforme*

Default Value: *MSK_SOLVE_FREE*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_STABILITY_PRIORITY

Controls how high priority the numerical stability should be given.

Accepted Values: *[0 ;100]*

Default Value: *50*

Groups: *Simplex optimizer*

MSK_IPAR_SIM_SWITCH_OPTIMIZER

The simplex optimizer sometimes chooses to solve the dual problem instead of the primal problem. This implies that if you have chosen to use the dual simplex optimizer and the problem is dualized, then it actually makes sense to use the primal simplex optimizer instead. If this parameter is on and the problem is dualized and furthermore the simplex optimizer is chosen to be the primal (dual) one, then it is switched to the dual (primal).

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Simplex optimizer*

MSK_IPAR_SOLUTION_CALLBACK

Indicates whether solution call-backs will be performed during the optimization.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Progress call-back, Overall solver*

MSK_IPAR_SOL_FILTER_KEEP_BASIC

If turned on, then basic and super basic constraints and variables are written to the solution file independent of the filter setting.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Solution input/output*

MSK_IPAR_SOL_FILTER_KEEP_RANGED

If turned on, then ranged constraints and variables are written to the solution file independent of the filter setting.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Solution input/output*

MSK_IPAR_SOL_READ_NAME_WIDTH

When a solution is read by **MOSEK** and some constraint, variable or cone names contain blanks, then a maximum name width must be specified. A negative value implies that no name contains blanks.

Accepted Values: `[-inf ;+inf]`

Default Value: `-1`

Groups: *Data input/output, Solution input/output*

MSK_IPAR_SOL_READ_WIDTH

Controls the maximal acceptable width of line in the solutions when read by **MOSEK**.

Accepted Values: `[0 ;+inf]`

Default Value: `1024`

Groups: *Data input/output, Solution input/output*

MSK_IPAR_TIMING_LEVEL

Controls the amount of timing performed inside **MOSEK**.

Accepted Values: `[0 ;+inf]`

Default Value: `1`

Groups: *Optimization system*

MSK_IPAR_WRITE_BASIC_CONSTRAINTS

Controls whether the constraint section is written to the basic solution file.

Accepted Values: *MSKOnoffkey*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_BASIC_HEADER

Controls whether the header section is written to the basic solution file.

Accepted Values: *MSKOnoffkey*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_BASIC_VARIABLES

Controls whether the variables section is written to the basic solution file.

Accepted Values: *MSKOnoffkey*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_DATA_COMPRESSED

Controls whether the data file is compressed while it is written. 0 means no compression while higher values mean more compression.

Accepted Values: `[0 ;+inf]`

Default Value: `0`

Groups: *Data input/output*

MSK_IPAR_WRITE_DATA_FORMAT

Controls the data format when a task is written using *task.writedata*.

Accepted Values: *MSKdataformat*

Default Value: *MSK_DATA_FORMAT_EXTENSION*

Groups: *Data input/output*

MSK_IPAR_WRITE_DATA_PARAM

If this option is turned on the parameter settings are written to the data file as parameters.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_WRITE_FREE_CON

Controls whether the free constraints are written to the data file.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_WRITE_GENERIC_NAMES

Controls whether the generic names or user-defined names are used in the data file.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_WRITE_GENERIC_NAMES_IO

Index origin used in generic names.

Accepted Values: *[0 ;+inf]*

Default Value: *1*

Groups: *Data input/output*

MSK_IPAR_WRITE_IGNORE_INCOMPATIBLE_ITEMS

Controls if the writer ignores incompatible problem items when writing files.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_WRITE_INT_CONSTRAINTS

Controls whether the constraint section is written to the integer solution file.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_INT_HEAD

Controls whether the header section is written to the integer solution file.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_INT_VARIABLES

Controls whether the variables section is written to the integer solution file.

Accepted Values: *MSK_onoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_LP_FULL_OBJ

Write all variables, including the ones with 0-coefficients, in the objective.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_WRITE_LP_LINE_WIDTH

Maximum width of line in an LP file written by **MOSEK**.

Accepted Values: *[40 ;+inf]*

Default Value: *80*

Groups: *Data input/output*

MSK_IPAR_WRITE_LP_QUOTED_NAMES

If this option is turned on, then **MOSEK** will quote invalid LP names when writing an LP file.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_WRITE_LP_STRICT_FORMAT

Controls whether LP output files satisfy the LP format strictly.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output*

MSK_IPAR_WRITE_LP_TERMS_PER_LINE

Maximum number of terms on a single line in an LP file written by **MOSEK**. 0 means unlimited.

Accepted Values: *[0 ;+inf]*

Default Value: *10*

Groups: *Data input/output*

MSK_IPAR_WRITE_MPS_FORMAT

Controls in which format the MPS is written.

Accepted Values: *MSKmpsformate*

Default Value: *MSK_MPS_FORMAT_FREE*

Groups: *Data input/output*

MSK_IPAR_WRITE_MPS_INT

Controls if marker records are written to the MPS file to indicate whether variables are integer restricted.

Accepted Values: *MSKonoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_WRITE_PRECISION

Controls the precision with which double numbers are printed in the MPS data file. In general it is not worthwhile to use a value higher than 15.

Accepted Values: *[0 ;+inf]*

Default Value: *15*

Groups: *Data input/output*

MSK_IPAR_WRITE_SOL_BARVARIABLES

Controls whether the symmetric matrix variables section is written to the solution file.

Accepted Values: *MSKOnoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_SOL_CONSTRAINTS

Controls whether the constraint section is written to the solution file.

Accepted Values: *MSKOnoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_SOL_HEAD

Controls whether the header section is written to the solution file.

Accepted Values: *MSKOnoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_SOL_IGNORE_INVALID_NAMES

Even if the names are invalid MPS names, then they are employed when writing the solution file.

Accepted Values: *MSKOnoffkeye*

Default Value: *MSK_OFF*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_SOL_VARIABLES

Controls whether the variables section is written to the solution file.

Accepted Values: *MSKOnoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output, Solution input/output*

MSK_IPAR_WRITE_TASK_INC_SOL

Controls whether the solutions are stored in the task file too.

Accepted Values: *MSKOnoffkeye*

Default Value: *MSK_ON*

Groups: *Data input/output*

MSK_IPAR_WRITE_XML_MODE

Controls if linear coefficients should be written by row or column when writing in the XML file format.

Accepted Values: *MSKxmlwriteroutputtypee*

Default Value: *MSK_WRITE_XML_MODE_ROW*

Groups: *Data input/output*

String Parameters**MSK_SPAR_BAS_SOL_FILE_NAME**

Name of the bas solution file.

Accepted Values: Any valid file name.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_DATA_FILE_NAME

Data are read and written to this file.

Accepted Values: Any valid file name.

Groups: *Data input/output*

MSK_SPAR_DEBUG_FILE_NAME

MOSEK debug file.

Accepted Values: Any valid file name.

Groups: *Data input/output*

MSK_SPAR_INT_SOL_FILE_NAME

Name of the `int` solution file.

Accepted Values: Any valid file name.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_ITR_SOL_FILE_NAME

Name of the `itr` solution file.

Accepted Values: Any valid file name.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_MIO_DEBUG_STRING

For internal use only.

Accepted Values: Any valid string.

Groups: *Data input/output*

MSK_SPAR_PARAM_COMMENT_SIGN

Only the first character in this string is used. It is considered as a start of comment sign in the **MOSEK** parameter file. Spaces are ignored in the string.

Accepted Values: Any valid string.

Default Value: `%%`

Groups: *Data input/output*

MSK_SPAR_PARAM_READ_FILE_NAME

Modifications to the parameter database is read from this file.

Accepted Values: Any valid file name.

Groups: *Data input/output*

MSK_SPAR_PARAM_WRITE_FILE_NAME

The parameter database is written to this file.

Accepted Values: Any valid file name.

Groups: *Data input/output*

MSK_SPAR_READ_MPS_BOU_NAME

Name of the `BOUNDS` vector used. An empty name means that the first `BOUNDS` vector is used.

Accepted Values: Any valid MPS name.

Groups: *Data input/output*

MSK_SPAR_READ_MPS_OBJ_NAME

Name of the free constraint used as objective function. An empty name means that the first constraint is used as objective function.

Accepted Values: Any valid MPS name.

Groups: *Data input/output*

MSK_SPAR_READ_MPS_RAN_NAME

Name of the RANGE vector used. An empty name means that the first RANGE vector is used.

Accepted Values: Any valid MPS name.

Groups: *Data input/output*

MSK_SPAR_READ_MPS_RHS_NAME

Name of the RHS used. An empty name means that the first RHS vector is used.

Accepted Values: Any valid MPS name.

Groups: *Data input/output*

MSK_SPAR_REMOTE_ACCESS_TOKEN

An access token used to submit tasks to a remote **MOSEK** server. An access token is a random 32-byte string encoded in base64, i.e. it is a 44 character ASCII string.

Accepted Values: Any valid string.

MSK_SPAR_SENSITIVITY_FILE_NAME

If defined *task.sensitivityreport* reads this file as a sensitivity analysis data file specifying the type of analysis to be done.

Accepted Values: Any valid string.

Groups: *Data input/output*

MSK_SPAR_SENSITIVITY_RES_FILE_NAME

If this is a nonempty string, then *task.sensitivityreport* writes results to this file.

Accepted Values: Any valid string.

Groups: *Data input/output*

MSK_SPAR_SOL_FILTER_XC_LOW

A filter used to determine which constraints should be listed in the solution file. A value of 0.5 means that all constraints having $xc[i] > 0.5$ should be listed, whereas +0.5 means that all constraints having $xc[i] \geq blc[i] + 0.5$ should be listed. An empty filter means that no filter is applied.

Accepted Values: Any valid filter.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_SOL_FILTER_XC_UPR

A filter used to determine which constraints should be listed in the solution file. A value of 0.5 means that all constraints having $xc[i] < 0.5$ should be listed, whereas -0.5 means all constraints having $xc[i] \leq buc[i] - 0.5$ should be listed. An empty filter means that no filter is applied.

Accepted Values: Any valid filter.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_SOL_FILTER_XX_LOW

A filter used to determine which variables should be listed in the solution file. A value of "0.5" means that all constraints having $xx[j] \geq 0.5$ should be listed, whereas "+0.5" means that all constraints having $xx[j] \geq blx[j] + 0.5$ should be listed. An empty filter means no filter is applied.

Accepted Values: Any valid filter.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_SOL_FILTER_XX_UPR

A filter used to determine which variables should be listed in the solution file. A value of "0.5" means that all constraints having $xx[j] < 0.5$ should be printed, whereas "-0.5" means all constraints having $xx[j] \leq bux[j] - 0.5$ should be listed. An empty filter means no filter is applied.

Accepted Values: Any valid file name.

Groups: *Data input/output, Solution input/output*

MSK_SPAR_STAT_FILE_NAME

Statistics file name.

Accepted Values: Any valid file name.

Groups: *Data input/output*

MSK_SPAR_STAT_KEY

Key used when writing the summary file.

Accepted Values: Any valid XML string.

Groups: *Data input/output*

MSK_SPAR_STAT_NAME

Name used when writing the statistics file.

Accepted Values: Any valid XML string.

Groups: *Data input/output*

MSK_SPAR_WRITE_LP_GEN_VAR_NAME

Sometimes when an LP file is written additional variables must be inserted. They will have the prefix denoted by this parameter.

Accepted Values: Any valid string.

Default Value: xmskgen

Groups: *Data input/output*

16.4.2 Conic interior-point method parameters.

- *MSK_DPAR_INTPNT_CO_TOL_DFEAS*
- *MSK_DPAR_INTPNT_CO_TOL_INFEAS*
- *MSK_DPAR_INTPNT_CO_TOL_MU_RED*
- *MSK_DPAR_INTPNT_CO_TOL_NEAR_REL*
- *MSK_DPAR_INTPNT_CO_TOL_PFEAS*
- *MSK_DPAR_INTPNT_CO_TOL_REL_GAP*

16.4.3 License manager parameters.

- *MSK_IPAR_CACHE_LICENSE*
- *MSK_IPAR_LICENSE_DEBUG*
- *MSK_IPAR_LICENSE_PAUSE_TIME*
- *MSK_IPAR_LICENSE_SUPPRESS_EXPIRE_WRNS*
- *MSK_IPAR_LICENSE_WAIT*

16.4.4 Logging parameters.

- *MSK_IPAR_LOG*
- *MSK_IPAR_LOG_ANA_PRO*
- *MSK_IPAR_LOG_BI*
- *MSK_IPAR_LOG_BI_FREQ*
- *MSK_IPAR_LOG_CUT_SECOND_OPT*

- *MSK_IPAR_LOG_EXPAND*
- *MSK_IPAR_LOG_FACTOR*
- *MSK_IPAR_LOG_FEAS_REPAIR*
- *MSK_IPAR_LOG_FILE*
- *MSK_IPAR_LOG_HEAD*
- *MSK_IPAR_LOG_INFEAS_ANA*

- *Error codes*
- *Warning codes*

16.5.1 Termination Codes

MSK_RES_OK (0)

No error occurred.

MSK_RES_TRM_INTERNAL (10030)

The optimizer terminated due to some internal reason. Please contact **MOSEK** support.

MSK_RES_TRM_INTERNAL_STOP (10031)

The optimizer terminated for internal reasons. Please contact **MOSEK** support.

MSK_RES_TRM_MAX_ITERATIONS (10000)

The optimizer terminated at the maximum number of iterations.

MSK_RES_TRM_MAX_NUM_SETBACKS (10020)

The optimizer terminated as the maximum number of set-backs was reached. This indicates % serious numerical problems and a possibly badly formulated problem.

MSK_RES_TRM_MAX_TIME (10001)

The optimizer terminated at the maximum amount of time.

MSK_RES_TRM_MIO_NEAR_ABS_GAP (10004)

The mixed-integer optimizer terminated because the near optimal absolute gap tolerance was satisfied.

MSK_RES_TRM_MIO_NEAR_REL_GAP (10003)

The mixed-integer optimizer terminated because the near optimal relative gap tolerance was satisfied.

MSK_RES_TRM_MIO_NUM_BRANCHES (10009)

The mixed-integer optimizer terminated as to the maximum number of branches was reached.

MSK_RES_TRM_MIO_NUM_RELAXS (10008)

The mixed-integer optimizer terminated as the maximum number of relaxations was reached.

MSK_RES_TRM_NUM_MAX_NUM_INT_SOLUTIONS (10015)

The mixed-integer optimizer terminated as the maximum number of feasible solutions was reached.

MSK_RES_TRM_NUMERICAL_PROBLEM (10025)

The optimizer terminated due to numerical problems.

MSK_RES_TRM_OBJECTIVE_RANGE (10002)

The optimizer terminated on the bound of the objective range.

MSK_RES_TRM_STALL (10006)

The optimizer is terminated due to slow progress.

Stalling means that numerical problems prevent the optimizer from making reasonable progress and that it make no sense to continue. In many cases this happens if the problem is badly scaled or otherwise ill-conditioned. There is no guarantee that the solution will be (near) feasible or near optimal. However, often stalling happens near the optimum, and the returned solution may be of good quality. Therefore, it is recommended to check the status of then solution. If the solution near optimal the solution is most likely good enough for most practical purposes.

Please note that if a linear optimization problem is solved using the interior-point optimizer with basis identification turned on, the returned basic solution likely to have high accuracy, even though the optimizer stalled.

Some common causes of stalling are a) badly scaled models, b) near feasible or near infeasible problems and c) a non-convex problems. Case c) is only relevant for general non-linear problems. It is not possible in general for **MOSEK** to check if a specific problems is convex since such a check would be NP hard in itself. This implies that care should be taken when solving problems involving general user defined functions.

MSK_RES_TRM_USER_CALLBACK (10007)

The optimizer terminated due to the return of the user-defined call-back function.

16.5.2 Error Codes

MSK_RES_ERR_AD_INVALID_CODELIST (3102)

The code list data was invalid.

MSK_RES_ERR_API_ARRAY_TOO_SMALL (3001)

An input array was too short.

MSK_RES_ERR_API_CB_CONNECT (3002)	Failed to connect a callback object.
MSK_RES_ERR_API_FATAL_ERROR (3005)	An internal error occurred in the API. Please report this problem.
MSK_RES_ERR_API_INTERNAL (3999)	An internal fatal error occurred in an interface function.
MSK_RES_ERR_ARG_IS_TOO_LARGE (1227)	The value of a argument is too small.
MSK_RES_ERR_ARG_IS_TOO_SMALL (1226)	The value of a argument is too small.
MSK_RES_ERR_ARGUMENT_DIMENSION (1201)	A function argument is of incorrect dimension.
MSK_RES_ERR_ARGUMENT_IS_TOO_LARGE (5005)	The value of a function argument is too large.
MSK_RES_ERR_ARGUMENT_LENNEQ (1197)	Incorrect length of arguments.
MSK_RES_ERR_ARGUMENT_PERM_ARRAY (1299)	An invalid permutation array is specified.
MSK_RES_ERR_ARGUMENT_TYPE (1198)	Incorrect argument type.
MSK_RES_ERR_BAR_VAR_DIM (3920)	The dimension of a symmetric matrix variable has to greater than 0.
MSK_RES_ERR_BASIS (1266)	An invalid basis is specified. Either too many or too few basis variables are specified.
MSK_RES_ERR_BASIS_FACTOR (1610)	The factorization of the basis is invalid.
MSK_RES_ERR_BASIS_SINGULAR (1615)	The basis is singular and hence cannot be factored.
MSK_RES_ERR_BLANK_NAME (1070)	An all blank name has been specified.
MSK_RES_ERR_CANNOT_CLONE_NL (2505)	A task with a nonlinear function call-back cannot be cloned.
MSK_RES_ERR_CANNOT_HANDLE_NL (2506)	A function cannot handle a task with nonlinear function call-backs.
MSK_RES_ERR_CBF_DUPLICATE_ACOORD (7116)	Duplicate index in ACOORD.
MSK_RES_ERR_CBF_DUPLICATE_BCOORD (7115)	Duplicate index in BCOORD.
MSK_RES_ERR_CBF_DUPLICATE_CON (7108)	Duplicate CON keyword.
MSK_RES_ERR_CBF_DUPLICATE_INT (7110)	Duplicate INT keyword.
MSK_RES_ERR_CBF_DUPLICATE_OBJ (7107)	Duplicate OBJ keyword.
MSK_RES_ERR_CBF_DUPLICATE_OBJACCOORD (7114)	Duplicate index in OBJCOORD.

MSK_RES_ERR_CBF_DUPLICATE_VAR (7109)

Duplicate VAR keyword.

MSK_RES_ERR_CBF_INVALID_CON_TYPE (7112)

Invalid constraint type.

MSK_RES_ERR_CBF_INVALID_DOMAIN_DIMENSION (7113)

Invalid domain dimension.

MSK_RES_ERR_CBF_INVALID_INT_INDEX (7121)

Invalid INT index.

MSK_RES_ERR_CBF_INVALID_VAR_TYPE (7111)

Invalid variable type.

MSK_RES_ERR_CBF_NO_VARIABLES (7102)

No variables are specified.

MSK_RES_ERR_CBF_NO_VERSION_SPECIFIED (7105)

No version specified.

MSK_RES_ERR_CBF_OBJ_SENSE (7101)

An invalid objective sense is specified.

MSK_RES_ERR_CBF_PARSE (7100)

An error occurred while parsing an CBF file.

MSK_RES_ERR_CBF_SYNTAX (7106)

Invalid syntax.

MSK_RES_ERR_CBF_TOO_FEW_CONSTRAINTS (7118)

Too few constraints defined.

MSK_RES_ERR_CBF_TOO_FEW_INTS (7119)

Too few ints are specified.

MSK_RES_ERR_CBF_TOO_FEW_VARIABLES (7117)

Too few variables defined.

MSK_RES_ERR_CBF_TOO_MANY_CONSTRAINTS (7103)

Too many constraints specified.

MSK_RES_ERR_CBF_TOO_MANY_INTS (7120)

Too many ints are specified.

MSK_RES_ERR_CBF_TOO_MANY_VARIABLES (7104)

Too many variables specified.

MSK_RES_ERR_CBF_UNSUPPORTED (7122)

Unsupported feature is present.

MSK_RES_ERR_CON_Q_NOT_NSD (1294)

The quadratic constraint matrix is not negative semidefinite as expected for a constraint with finite lower bound. This results in a nonconvex problem. The parameter [*MSK_DPAR_CHECK_CONVEXITY_REL_TOL*](#) can be used to relax the convexity check.

MSK_RES_ERR_CON_Q_NOT_PSD (1293)

The quadratic constraint matrix is not positive semidefinite as expected for a constraint with finite upper bound. This results in a nonconvex problem. The parameter [*MSK_DPAR_CHECK_CONVEXITY_REL_TOL*](#) can be used to relax the convexity check.

MSK_RES_ERR_CONE_INDEX (1300)

An index of a non-existing cone has been specified.

MSK_RES_ERR_CONE_OVERLAP (1302)

One or more of the variables in the cone to be added is already member of another cone. Now

assume the variable is x_j then add a new variable say x_k and the constraint

$$x_j = x_k$$

and then let x_k be member of the cone to be appended.

MSK_RES_ERR_CONE_OVERLAP_APPEND (1307)

The cone to be appended has one variable which is already member of another cone.

MSK_RES_ERR_CONE_REP_VAR (1303)

A variable is included multiple times in the cone.

MSK_RES_ERR_CONE_SIZE (1301)

A cone with too few members is specified.

MSK_RES_ERR_CONE_TYPE (1305)

Invalid cone type specified.

MSK_RES_ERR_CONE_TYPE_STR (1306)

Invalid cone type specified.

MSK_RES_ERR_DATA_FILE_EXT (1055)

The data file format cannot be determined from the file name.

MSK_RES_ERR_DUP_NAME (1071)

The same name was used multiple times for the same problem item type.

MSK_RES_ERR_DUPLICATE_AIJ (1385)

An element in the A matrix is specified twice.

MSK_RES_ERR_DUPLICATE_BARVARIABLE_NAMES (4502)

Two barvariable names are identical.

MSK_RES_ERR_DUPLICATE_CONE_NAMES (4503)

Two cone names are identical.

MSK_RES_ERR_DUPLICATE_CONSTRAINT_NAMES (4500)

Two constraint names are identical.

MSK_RES_ERR_DUPLICATE_VARIABLE_NAMES (4501)

Two variable names are identical.

MSK_RES_ERR_END_OF_FILE (1059)

End of file reached.

MSK_RES_ERR_FACTOR (1650)

An error occurred while factorizing a matrix.

MSK_RES_ERR_FEASREPAIR_CANNOT_RELAX (1700)

An optimization problem cannot be relaxed. This is the case e.g. for general nonlinear optimization problems.

MSK_RES_ERR_FEASREPAIR_INCONSISTENT_BOUND (1702)

The upper bound is less than the lower bound for a variable or a constraint. Please correct this before running the feasibility repair.

MSK_RES_ERR_FEASREPAIR_SOLVING_RELAXED (1701)

The relaxed problem could not be solved to optimality. Please consult the log file for further details.

MSK_RES_ERR_FILE_LICENSE (1007)

Invalid license file.

MSK_RES_ERR_FILE_OPEN (1052)

Error while opening a file.

MSK_RES_ERR_FILE_READ (1053)

File read error.

MSK_RES_ERR_FILE_WRITE (1054)

File write error.

MSK_RES_ERR_FIRST (1261)

Invalid first.

MSK_RES_ERR_FIRSTI (1285)

Invalid firsti.

MSK_RES_ERR_FIRSTJ (1287)

Invalid firstj.

MSK_RES_ERR_FIXED_BOUND_VALUES (1425)

A fixed constraint/variable has been specified using the bound keys but the numerical value of the lower and upper bound is different.

MSK_RES_ERR_FLEXLM (1014)

The FLEXlm license manager reported an error.

MSK_RES_ERR_GLOBAL_INV_CONIC_PROBLEM (1503)

The global optimizer can only be applied to problems without semidefinite variables.

MSK_RES_ERR_HUGE_AIJ (1380)

A numerically huge value is specified for an $a_{i,j}$ element in A . The parameter *MSK_DPAR_DATA_TOL_AIJ_HUGE* controls when an $a_{i,j}$ is considered huge.

MSK_RES_ERR_HUGE_C (1375)

A huge value in absolute size is specified for one c_j .

MSK_RES_ERR_IDENTICAL_TASKS (3101)

Some tasks related to this function call were identical. Unique tasks were expected.

MSK_RES_ERR_IN_ARGUMENT (1200)

A function argument is incorrect.

MSK_RES_ERR_INDEX (1235)

An index is out of range.

MSK_RES_ERR_INDEX_ARR_IS_TOO_LARGE (1222)

An index in an array argument is too large.

MSK_RES_ERR_INDEX_ARR_IS_TOO_SMALL (1221)

An index in an array argument is too small.

MSK_RES_ERR_INDEX_IS_TOO_LARGE (1204)

An index in an argument is too large.

MSK_RES_ERR_INDEX_IS_TOO_SMALL (1203)

An index in an argument is too small.

MSK_RES_ERR_INF_DOU_INDEX (1219)

A double information index is out of range for the specified type.

MSK_RES_ERR_INF_DOU_NAME (1230)

A double information name is invalid.

MSK_RES_ERR_INF_INT_INDEX (1220)

An integer information index is out of range for the specified type.

MSK_RES_ERR_INF_INT_NAME (1231)

An integer information name is invalid.

MSK_RES_ERR_INF_LINT_INDEX (1225)

A long integer information index is out of range for the specified type.

MSK_RES_ERR_INF_LINT_NAME (1234)

A long integer information name is invalid.

MSK_RES_ERR_INF_TYPE (1232)

The information type is invalid.

MSK_RES_ERR_INFEAS_UNDEFINED (3910)

The requested value is not defined for this solution type.

MSK_RES_ERR_INFINITE_BOUND (1400)

A numerically huge bound value is specified.

MSK_RES_ERR_INT64_TO_INT32_CAST (3800)

An 32 bit integer could not cast to a 64 bit integer.

MSK_RES_ERR_INTERNAL (3000)

An internal error occurred. Please report this problem.

MSK_RES_ERR_INTERNAL_TEST_FAILED (3500)

An internal unit test function failed.

MSK_RES_ERR_INV_APTRE (1253)

`aptre[j]` is strictly smaller than `aptrb[j]` for some `j`.

MSK_RES_ERR_INV_BK (1255)

Invalid bound key.

MSK_RES_ERR_INV_BKC (1256)

Invalid bound key is specified for a constraint.

MSK_RES_ERR_INV_BKX (1257)

An invalid bound key is specified for a variable.

MSK_RES_ERR_INV_CONE_TYPE (1272)

Invalid cone type code is encountered.

MSK_RES_ERR_INV_CONE_TYPE_STR (1271)

Invalid cone type string encountered.

MSK_RES_ERR_INV_MARKI (2501)

Invalid value in `marki`.

MSK_RES_ERR_INV_MARKJ (2502)

Invalid value in `markj`.

MSK_RES_ERR_INV_NAME_ITEM (1280)

An invalid name item code is used.

MSK_RES_ERR_INV_NUMI (2503)

Invalid `numi`.

MSK_RES_ERR_INV_NUMJ (2504)

Invalid `numj`.

MSK_RES_ERR_INV_OPTIMIZER (1550)

An invalid optimizer has been chosen for the problem. This means that the simplex or the conic optimizer is chosen to optimize a nonlinear problem.

MSK_RES_ERR_INV_PROBLEM (1500)

Invalid problem type. Probably a nonconvex problem has been specified.

MSK_RES_ERR_INV_QCON_SUBI (1405)

Invalid value in `qconsubi`.

MSK_RES_ERR_INV_QCON_SUBJ (1406)

Invalid value in `qconsubj`.

MSK_RES_ERR_INV_QCON_SUBK (1404)

Invalid value in `qconsubk`.

MSK_RES_ERR_INV_QCON_VAL (1407)

Invalid value in `qcval`.

MSK_RES_ERR_INV_QOBJ_SUBI (1401)
Invalid value in `qosubi`.

MSK_RES_ERR_INV_QOBJ_SUBJ (1402)
Invalid value in `qosubj`.

MSK_RES_ERR_INV_QOBJ_VAL (1403)
Invalid value in `qoval`.

MSK_RES_ERR_INV_SK (1270)
Invalid status key code.

MSK_RES_ERR_INV_SK_STR (1269)
Invalid status key string encountered.

MSK_RES_ERR_INV_SKC (1267)
Invalid value in `skc`.

MSK_RES_ERR_INV_SKN (1274)
Invalid value in `skn`.

MSK_RES_ERR_INV_SKX (1268)
Invalid value in `skx`.

MSK_RES_ERR_INV_VAR_TYPE (1258)
An invalid variable type is specified for a variable.

MSK_RES_ERR_INVALID_ACCMODE (2520)
An invalid access mode is specified.

MSK_RES_ERR_INVALID_AIJ (1473)
 $a_{i,j}$ contains an invalid floating point value, i.e. a NaN or an infinite value.

MSK_RES_ERR_INVALID_AMPL_STUB (3700)
Invalid AMPL stub.

MSK_RES_ERR_INVALID_BARVAR_NAME (1079)
An invalid symmetric matrix variable name is used.

MSK_RES_ERR_INVALID_COMPRESSION (1800)
Invalid compression type.

MSK_RES_ERR_INVALID_CON_NAME (1076)
An invalid constraint name is used.

MSK_RES_ERR_INVALID_CONE_NAME (1078)
An invalid cone name is used.

MSK_RES_ERR_INVALID_FILE_FORMAT_FOR_CONES (4005)
The file format does not support a problem with conic constraints.

MSK_RES_ERR_INVALID_FILE_FORMAT_FOR_GENERAL_NL (4010)
The file format does not support a problem with general nonlinear terms.

MSK_RES_ERR_INVALID_FILE_FORMAT_FOR_SYM_MAT (4000)
The file format does not support a problem with symmetric matrix variables.

MSK_RES_ERR_INVALID_FILE_NAME (1056)
An invalid file name has been specified.

MSK_RES_ERR_INVALID_FORMAT_TYPE (1283)
Invalid format type.

MSK_RES_ERR_INVALID_IDX (1246)
A specified index is invalid.

MSK_RES_ERR_INVALID_IOMODE (1801)
Invalid io mode.

MSK_RES_ERR_INVALID_MAX_NUM (1247)
A specified index is invalid.

MSK_RES_ERR_INVALID_NAME_IN_SOL_FILE (1170)
An invalid name occurred in a solution file.

MSK_RES_ERR_INVALID_OBJ_NAME (1075)
An invalid objective name is specified.

MSK_RES_ERR_INVALID_OBJECTIVE_SENSE (1445)
An invalid objective sense is specified.

MSK_RES_ERR_INVALID_PROBLEM_TYPE (6000)
An invalid problem type.

MSK_RES_ERR_INVALID_SOL_FILE_NAME (1057)
An invalid file name has been specified.

MSK_RES_ERR_INVALID_STREAM (1062)
An invalid stream is referenced.

MSK_RES_ERR_INVALID_SURPLUS (1275)
Invalid surplus.

MSK_RES_ERR_INVALID_SYM_MAT_DIM (3950)
A sparse symmetric matrix of invalid dimension is specified.

MSK_RES_ERR_INVALID_TASK (1064)
The `task` is invalid.

MSK_RES_ERR_INVALID_UTF8 (2900)
An invalid UTF8 string is encountered.

MSK_RES_ERR_INVALID_VAR_NAME (1077)
An invalid variable name is used.

MSK_RES_ERR_INVALID_WCHAR (2901)
An invalid `wchar` string is encountered.

MSK_RES_ERR_INVALID_WHICH_SOL (1228)
`whichsol` is invalid.

MSK_RES_ERR_JSON_DATA (1179)
Inconsistent data in JSON Task file

MSK_RES_ERR_JSON_FORMAT (1178)
Error in an JSON Task file

MSK_RES_ERR_JSON_MISSING_DATA (1180)
Missing data section in JSON task file.

MSK_RES_ERR_JSON_NUMBER_OVERFLOW (1177)
Invalid number entry - wrong type or value overflow.

MSK_RES_ERR_JSON_STRING (1176)
Error in JSON string.

MSK_RES_ERR_JSON_SYNTAX (1175)
Syntax error in an JSON data

MSK_RES_ERR_LAST (1262)
Invalid index `last`. A given index was out of expected range.

MSK_RES_ERR_LASTI (1286)
Invalid `lasti`.

MSK_RES_ERR_LASTJ (1288)
Invalid `lastj`.

MSK_RES_ERR_LAU_ARG_K (7012)
Invalid argument k.

MSK_RES_ERR_LAU_ARG_M (7010)
Invalid argument m.

MSK_RES_ERR_LAU_ARG_N (7011)
Invalid argument n.

MSK_RES_ERR_LAU_ARG_TRANS (7018)
Invalid argument trans.

MSK_RES_ERR_LAU_ARG_TRANSA (7015)
Invalid argument transa.

MSK_RES_ERR_LAU_ARG_TRANSB (7016)
Invalid argument transb.

MSK_RES_ERR_LAU_ARG_UPLO (7017)
Invalid argument uplo.

MSK_RES_ERR_LAU_INVALID_LOWER_TRIANGULAR_MATRIX (7002)
An invalid lower triangular matrix.

MSK_RES_ERR_LAU_INVALID_SPARSE_SYMMETRIC_MATRIX (7019)
An invalid sparse symmetric matrix is specified. Note only the lower triangular part with no duplicates is specified.

MSK_RES_ERR_LAU_NOT_POSITIVE_DEFINITE (7001)
A matrix is not positive definite.

MSK_RES_ERR_LAU_SINGULAR_MATRIX (7000)
A matrix is singular.

MSK_RES_ERR_LAU_UNKNOWN (7005)
An unknown error.

MSK_RES_ERR_LICENSE (1000)
Invalid license.

MSK_RES_ERR_LICENSE_CANNOT_ALLOCATE (1020)
The license system cannot allocate the memory required.

MSK_RES_ERR_LICENSE_CANNOT_CONNECT (1021)
MOSEK cannot connect to the license server. Most likely the license server is not up and running.

MSK_RES_ERR_LICENSE_EXPIRED (1001)
The license has expired.

MSK_RES_ERR_LICENSE_FEATURE (1018)
A requested feature is not available in the license file(s). Most likely due to an incorrect license system setup.

MSK_RES_ERR_LICENSE_INVALID_HOSTID (1025)
The host ID specified in the license file does not match the host ID of the computer.

MSK_RES_ERR_LICENSE_MAX (1016)
Maximum number of licenses is reached.

MSK_RES_ERR_LICENSE_MOSEKLM_DAEMON (1017)
The MOSEKLM license manager daemon is not up and running.

MSK_RES_ERR_LICENSE_NO_SERVER_LINE (1028)
There is no **SERVER** line in the license file. All non-zero license count features need at least one **SERVER** line.

MSK_RES_ERR_LICENSE_NO_SERVER_SUPPORT (1027)
The license server does not support the requested feature. Possible reasons for this error include:

- The feature has expired.
- The feature's start date is later than today's date.
- The version requested is higher than feature's the highest supported version.
- A corrupted license file.

Try restarting the license and inspect the license server debug file, usually called `lmgrd.log`.

MSK_RES_ERR_LICENSE_SERVER (1015)

The license server is not responding.

MSK_RES_ERR_LICENSE_SERVER_VERSION (1026)

The version specified in the checkout request is greater than the highest version number the daemon supports.

MSK_RES_ERR_LICENSE_VERSION (1002)

The license is valid for another version of **MOSEK**.

MSK_RES_ERR_LINK_FILE_DLL (1040)

A file cannot be linked to a stream in the DLL version.

MSK_RES_ERR_LIVING_TASKS (1066)

All tasks associated with an environment must be deleted before the environment is deleted. There are still some undeleted tasks.

MSK_RES_ERR_LOWER_BOUND_IS_A_NAN (1390)

The lower bound specified is not a number (nan).

MSK_RES_ERR_LP_DUP_SLACK_NAME (1152)

The name of the slack variable added to a ranged constraint already exists.

MSK_RES_ERR_LP_EMPTY (1151)

The problem cannot be written to an LP formatted file.

MSK_RES_ERR_LP_FILE_FORMAT (1157)

Syntax error in an LP file.

MSK_RES_ERR_LP_FORMAT (1160)

Syntax error in an LP file.

MSK_RES_ERR_LP_FREE_CONSTRAINT (1155)

Free constraints cannot be written in LP file format.

MSK_RES_ERR_LP_INCOMPATIBLE (1150)

The problem cannot be written to an LP formatted file.

MSK_RES_ERR_LP_INVALID_CON_NAME (1171)

A constraint name is invalid when used in an LP formatted file.

MSK_RES_ERR_LP_INVALID_VAR_NAME (1154)

A variable name is invalid when used in an LP formatted file.

MSK_RES_ERR_LP_WRITE_CONIC_PROBLEM (1163)

The problem contains cones that cannot be written to an LP formatted file.

MSK_RES_ERR_LP_WRITE_GECO_PROBLEM (1164)

The problem contains general convex terms that cannot be written to an LP formatted file.

MSK_RES_ERR_LU_MAX_NUM_TRIES (2800)

Could not compute the LU factors of the matrix within the maximum number of allowed tries.

MSK_RES_ERR_MAX_LEN_IS_TOO_SMALL (1289)

An maximum length that is too small has been specified.

MSK_RES_ERR_MAXNUMBERVAR (1242)

The maximum number of semidefinite variables specified is smaller than the number of semidefinite variables in the task.

MSK_RES_ERR_MAXNUMCON (1240)

The maximum number of constraints specified is smaller than the number of constraints in the task.

MSK_RES_ERR_MAXNUMCONE (1304)

The value specified for `maxnumcone` is too small.

MSK_RES_ERR_MAXNUMQNZ (1243)

The maximum number of non-zeros specified for the Q matrices is smaller than the number of non-zeros in the current Q matrices.

MSK_RES_ERR_MAXNUMVAR (1241)

The maximum number of variables specified is smaller than the number of variables in the task.

MSK_RES_ERR_MIO_INTERNAL (5010)

A fatal error occurred in the mixed integer optimizer. Please contact **MOSEK** support.

MSK_RES_ERR_MIO_INVALID_NODE_OPTIMIZER (7131)

An invalid node optimizer was selected for the problem type.

MSK_RES_ERR_MIO_INVALID_ROOT_OPTIMIZER (7130)

An invalid root optimizer was selected for the problem type.

MSK_RES_ERR_MIO_NO_OPTIMIZER (1551)

No optimizer is available for the current class of integer optimization problems.

MSK_RES_ERR_MIO_NOT_LOADED (1553)

The mixed-integer optimizer is not loaded.

MSK_RES_ERR_MISSING_LICENSE_FILE (1008)

MOSEK cannot license file or a token server. See the **MOSEK** installation manual for details.

MSK_RES_ERR_MIXED_CONIC_AND_NL (1501)

The problem contains nonlinear terms conic constraints. The requested operation cannot be applied to this type of problem.

MSK_RES_ERR_MPS_CONE_OVERLAP (1118)

A variable is specified to be a member of several cones.

MSK_RES_ERR_MPS_CONE_REPEAT (1119)

A variable is repeated within the `CSECTION`.

MSK_RES_ERR_MPS_CONE_TYPE (1117)

Invalid cone type specified in a `CSECTION`.

MSK_RES_ERR_MPS_DUPLICATE_Q_ELEMENT (1121)

Duplicate elements is specified in a Q matrix.

MSK_RES_ERR_MPS_FILE (1100)

An error occurred while reading an MPS file.

MSK_RES_ERR_MPS_INV_BOUND_KEY (1108)

An invalid bound key occurred in an MPS file.

MSK_RES_ERR_MPS_INV_CON_KEY (1107)

An invalid constraint key occurred in an MPS file.

MSK_RES_ERR_MPS_INV_FIELD (1101)

A field in the MPS file is invalid. Probably it is too wide.

MSK_RES_ERR_MPS_INV_MARKER (1102)

An invalid marker has been specified in the MPS file.

MSK_RES_ERR_MPS_INV_SEC_NAME (1109)

An invalid section name occurred in an MPS file.

MSK_RES_ERR_MPS_INV_SEC_ORDER (1115)

The sections in the MPS data file are not in the correct order.

- MSK_RES_ERR_MPS_INVALID_OBJ_NAME (1128)
An invalid objective name is specified.
- MSK_RES_ERR_MPS_INVALID_OBJSENSE (1122)
An invalid objective sense is specified.
- MSK_RES_ERR_MPS_MUL_CON_NAME (1112)
A constraint name was specified multiple times in the ROWS section.
- MSK_RES_ERR_MPS_MUL_CSEC (1116)
Multiple CSECTIONs are given the same name.
- MSK_RES_ERR_MPS_MUL_QOBJ (1114)
The Q term in the objective is specified multiple times in the MPS data file.
- MSK_RES_ERR_MPS_MUL_QSEC (1113)
Multiple QSECTIONs are specified for a constraint in the MPS data file.
- MSK_RES_ERR_MPS_NO_OBJECTIVE (1110)
No objective is defined in an MPS file.
- MSK_RES_ERR_MPS_NON_SYMMETRIC_Q (1120)
A non symmetric matrice has been speciefied.
- MSK_RES_ERR_MPS_NULL_CON_NAME (1103)
An empty constraint name is used in an MPS file.
- MSK_RES_ERR_MPS_NULL_VAR_NAME (1104)
An empty variable name is used in an MPS file.
- MSK_RES_ERR_MPS_SPLITTED_VAR (1111)
All elements in a column of the A matrix must be specified consecutively. Hence, it is illegal to specify non-zero elements in A for variable 1, then for variable 2 and then variable 1 again.
- MSK_RES_ERR_MPS_TAB_IN_FIELD2 (1125)
A tab char occurred in field 2.
- MSK_RES_ERR_MPS_TAB_IN_FIELD3 (1126)
A tab char occurred in field 3.
- MSK_RES_ERR_MPS_TAB_IN_FIELD5 (1127)
A tab char occurred in field 5.
- MSK_RES_ERR_MPS_UNDEF_CON_NAME (1105)
An undefined constraint name occurred in an MPS file.
- MSK_RES_ERR_MPS_UNDEF_VAR_NAME (1106)
An undefined variable name occurred in an MPS file.
- MSK_RES_ERR_MUL_A_ELEMENT (1254)
An element in A is defined multiple times.
- MSK_RES_ERR_NAME_IS_NULL (1760)
The name buffer is a NULL pointer.
- MSK_RES_ERR_NAME_MAX_LEN (1750)
A name is longer than the buffer that is supposed to hold it.
- MSK_RES_ERR_NAN_IN_BLC (1461)
 l^c contains an invalid floating point value, i.e. a NaN.
- MSK_RES_ERR_NAN_IN_BLX (1471)
 l^x contains an invalid floating point value, i.e. a NaN.
- MSK_RES_ERR_NAN_IN_BUC (1462)
 u^c contains an invalid floating point value, i.e. a NaN.
- MSK_RES_ERR_NAN_IN_BUX (1472)
 u^x contains an invalid floating point value, i.e. a NaN.

MSK_RES_ERR_NAN_IN_C (1470)

c contains an invalid floating point value, i.e. a NaN.

MSK_RES_ERR_NAN_IN_DOUBLE_DATA (1450)

An invalid floating point value was used in some double data.

MSK_RES_ERR_NEGATIVE_APPEND (1264)

Cannot append a negative number.

MSK_RES_ERR_NEGATIVE_SURPLUS (1263)

Negative surplus.

MSK_RES_ERR_NEWER_DLL (1036)

The dynamic link library is newer than the specified version.

MSK_RES_ERR_NO_BARS_FOR_SOLUTION (3916)

There is no \bar{s} available for the solution specified. In particular note there are no \bar{s} defined for the basic and integer solutions.

MSK_RES_ERR_NO_BARX_FOR_SOLUTION (3915)

There is no \bar{X} available for the solution specified. In particular note there are no \bar{X} defined for the basic and integer solutions.

MSK_RES_ERR_NO_BASIS_SOL (1600)

No basic solution is defined.

MSK_RES_ERR_NO_DUAL_FOR_ITG_SOL (2950)

No dual information is available for the integer solution.

MSK_RES_ERR_NO_DUAL_INFEAS_CER (2001)

A certificate of infeasibility is not available.

MSK_RES_ERR_NO_INIT_ENV (1063)

env is not initialized.

MSK_RES_ERR_NO_OPTIMIZER_VAR_TYPE (1552)

No optimizer is available for this class of optimization problems.

MSK_RES_ERR_NO_PRIMAL_INFEAS_CER (2000)

A certificate of primal infeasibility is not available.

MSK_RES_ERR_NO_SNX_FOR_BAS_SOL (2953)

s_n^x is not available for the basis solution.

MSK_RES_ERR_NO_SOLUTION_IN_CALLBACK (2500)

The required solution is not available.

MSK_RES_ERR_NON_UNIQUE_ARRAY (5000)

An array does not contain unique elements.

MSK_RES_ERR_NONCONVEX (1291)

The optimization problem is nonconvex.

MSK_RES_ERR_NONLINEAR_EQUALITY (1290)

The model contains a nonlinear equality which defines a nonconvex set.

MSK_RES_ERR_NONLINEAR_FUNCTIONS_NOT_ALLOWED (1428)

An operation that is invalid for problems with nonlinear functions defined has been attempted.

MSK_RES_ERR_NONLINEAR_RANGED (1292)

Nonlinear constraints with finite lower and upper bound always define a nonconvex feasible set.

MSK_RES_ERR_NR_ARGUMENTS (1199)

Incorrect number of function arguments.

MSK_RES_ERR_NULL_ENV (1060)

env is a NULL pointer.

MSK_RES_ERR_NULL_POINTER (1065)

An argument to a function is unexpectedly a NULL pointer.

MSK_RES_ERR_NULL_TASK (1061)

task is a NULL pointer.

MSK_RES_ERR_NUMCONLIM (1250)

Maximum number of constraints limit is exceeded.

MSK_RES_ERR_NUMVARLIM (1251)

Maximum number of variables limit is exceeded.

MSK_RES_ERR_OBJ_Q_NOT_NSD (1296)

The quadratic coefficient matrix in the objective is not negative semidefinite as expected for a maximization problem. The parameter *MSK_DPAR_CHECK_CONVEXITY_REL_TOL* can be used to relax the convexity check.

MSK_RES_ERR_OBJ_Q_NOT_PSD (1295)

The quadratic coefficient matrix in the objective is not positive semidefinite as expected for a minimization problem. The parameter *MSK_DPAR_CHECK_CONVEXITY_REL_TOL* can be used to relax the convexity check.

MSK_RES_ERR_OBJECTIVE_RANGE (1260)

Empty objective range.

MSK_RES_ERR_OLDER_DLL (1035)

The dynamic link library is older than the specified version.

MSK_RES_ERR_OPEN_DL (1030)

A dynamic link library could not be opened.

MSK_RES_ERR_OPF_FORMAT (1168)

Syntax error in an OPF file

MSK_RES_ERR_OPF_NEW_VARIABLE (1169)

Introducing new variables is now allowed. When a [variables] section is present, it is not allowed to introduce new variables later in the problem.

MSK_RES_ERR_OPF_PREMATURE_EOF (1172)

Premature end of file in an OPF file.

MSK_RES_ERR_OPTIMIZER_LICENSE (1013)

The optimizer required is not licensed.

MSK_RES_ERR_OVERFLOW (1590)

A computation produced an overflow i.e. a very large number.

MSK_RES_ERR_PARAM_INDEX (1210)

Parameter index is out of range.

MSK_RES_ERR_PARAM_IS_TOO_LARGE (1215)

The parameter value is too large.

MSK_RES_ERR_PARAM_IS_TOO_SMALL (1216)

The parameter value is too small.

MSK_RES_ERR_PARAM_NAME (1205)

The parameter name is not correct.

MSK_RES_ERR_PARAM_NAME_DOUB (1206)

The parameter name is not correct for a double parameter.

MSK_RES_ERR_PARAM_NAME_INT (1207)

The parameter name is not correct for an integer parameter.

MSK_RES_ERR_PARAM_NAME_STR (1208)

The parameter name is not correct for a string parameter.

MSK_RES_ERR_PARAM_TYPE (1218)

The parameter type is invalid.

MSK_RES_ERR_PARAM_VALUE_STR (1217)

The parameter value string is incorrect.

MSK_RES_ERR_PLATFORM_NOT_LICENSED (1019)

A requested license feature is not available for the required platform.

MSK_RES_ERR_POSTSOLVE (1580)

An error occurred during the postsolve. Please contact **MOSEK** support.

MSK_RES_ERR_PRO_ITEM (1281)

An invalid problem is used.

MSK_RES_ERR_PROB_LICENSE (1006)

The software is not licensed to solve the problem.

MSK_RES_ERR_QCON_SUBI_TOO_LARGE (1409)

Invalid value in `qcsubi`.

MSK_RES_ERR_QCON_SUBI_TOO_SMALL (1408)

Invalid value in `qcsubi`.

MSK_RES_ERR_QCON_UPPER_TRIANGLE (1417)

An element in the upper triangle of a Q^k is specified. Only elements in the lower triangle should be specified.

MSK_RES_ERR_QOBJ_UPPER_TRIANGLE (1415)

An element in the upper triangle of Q^o is specified. Only elements in the lower triangle should be specified.

MSK_RES_ERR_READ_FORMAT (1090)

The specified format cannot be read.

MSK_RES_ERR_READ_LP_MISSING_END_TAG (1159)

Syntax error in LP file. Possibly missing End tag.

MSK_RES_ERR_READ_LP_NONEXISTING_NAME (1162)

A variable never occurred in objective or constraints.

MSK_RES_ERR_REMOVE_CONE_VARIABLE (1310)

A variable cannot be removed because it will make a cone invalid.

MSK_RES_ERR_REPAIR_INVALID_PROBLEM (1710)

The feasibility repair does not support the specified problem type.

MSK_RES_ERR_REPAIR_OPTIMIZATION_FAILED (1711)

Computation the optimal relaxation failed. The cause may have been numerical problems.

MSK_RES_ERR_SEN_BOUND_INVALID_LO (3054)

Analysis of lower bound requested for an index, where no lower bound exists.

MSK_RES_ERR_SEN_BOUND_INVALID_UP (3053)

Analysis of upper bound requested for an index, where no upper bound exists.

MSK_RES_ERR_SEN_FORMAT (3050)

Syntax error in sensitivity analysis file.

MSK_RES_ERR_SEN_INDEX_INVALID (3055)

Invalid range given in the sensitivity file.

MSK_RES_ERR_SEN_INDEX_RANGE (3052)

Index out of range in the sensitivity analysis file.

MSK_RES_ERR_SEN_INVALID_REGEXP (3056)

Syntax error in regexp or regexp longer than 1024.

- MSK_RES_ERR_SEN_NUMERICAL (3058)**
Numerical difficulties encountered performing the sensitivity analysis.
- MSK_RES_ERR_SEN_SOLUTION_STATUS (3057)**
No optimal solution found to the original problem given for sensitivity analysis.
- MSK_RES_ERR_SEN_UNDEF_NAME (3051)**
An undefined name was encountered in the sensitivity analysis file.
- MSK_RES_ERR_SEN_UNHANDLED_PROBLEM_TYPE (3080)**
Sensitivity analysis cannot be performed for the specified problem. Sensitivity analysis is only possible for linear problems.
- MSK_RES_ERR_SERVER_CONNECT (8000)**
Failed to connect to remote solver server. The server string or the port string were invalid, or the server did not accept connection.
- MSK_RES_ERR_SERVER_PROTOCOL (8001)**
Unexpected message or data from solver server.
- MSK_RES_ERR_SERVER_STATUS (8002)**
Server returned non-ok HTTP status code
- MSK_RES_ERR_SERVER_TOKEN (8003)**
The job ID specified is incorrect or invalid
- MSK_RES_ERR_SIZE_LICENSE (1005)**
The problem is bigger than the license.
- MSK_RES_ERR_SIZE_LICENSE_CON (1010)**
The problem has too many constraints to be solved with the available license.
- MSK_RES_ERR_SIZE_LICENSE_INTVAR (1012)**
The problem contains too many integer variables to be solved with the available license.
- MSK_RES_ERR_SIZE_LICENSE_NUMCORES (3900)**
The computer contains more cpu cores than the license allows for.
- MSK_RES_ERR_SIZE_LICENSE_VAR (1011)**
The problem has too many variables to be solved with the available license.
- MSK_RES_ERR_SOL_FILE_INVALID_NUMBER (1350)**
An invalid number is specified in a solution file.
- MSK_RES_ERR_SOLITEM (1237)**
The solution item number `solitem` is invalid. Please note that `MSK_SOL_ITEM_SNX` is invalid for the basic solution.
- MSK_RES_ERR_SOLVER_PROBTYPE (1259)**
Problem type does not match the chosen optimizer.
- MSK_RES_ERR_SPACE (1051)**
Out of space.
- MSK_RES_ERR_SPACE_LEAKING (1080)**
MOSEK is leaking memory. This can be due to either an incorrect use of **MOSEK** or a bug.
- MSK_RES_ERR_SPACE_NO_INFO (1081)**
No available information about the space usage.
- MSK_RES_ERR_SYM_MAT_DUPLICATE (3944)**
A value in a symmetric matrix as been specified more than once.
- MSK_RES_ERR_SYM_MAT_HUGE (1482)**
A symmetric matrix contains a huge value in absolute size. The parameter `MSK_DPAR_DATA_SYM_MAT_TOL_HUGE` controls when an $e_{i,j}$ is considered huge.
- MSK_RES_ERR_SYM_MAT_INVALID (1480)**
A symmetric matrix contains an invalid floating point value, i.e. a NaN or an infinite value.

MSK_RES_ERR_SYM_MAT_INVALID_COL_INDEX (3941)

A column index specified for sparse symmetric matrix is invalid.

MSK_RES_ERR_SYM_MAT_INVALID_ROW_INDEX (3940)

A row index specified for sparse symmetric matrix is invalid.

MSK_RES_ERR_SYM_MAT_INVALID_VALUE (3943)

The numerical value specified in a sparse symmetric matrix is not a value floating value.

MSK_RES_ERR_SYM_MAT_NOT_LOWER_TRINGULAR (3942)

Only the lower triangular part of sparse symmetric matrix should be specified.

MSK_RES_ERR_TASK_INCOMPATIBLE (2560)

The Task file is incompatible with this platform. This results from reading a file on a 32 bit platform generated on a 64 bit platform.

MSK_RES_ERR_TASK_INVALID (2561)

The Task file is invalid.

MSK_RES_ERR_TASK_WRITE (2562)

Failed to write the task file.

MSK_RES_ERR_THREAD_COND_INIT (1049)

Could not initialize a condition.

MSK_RES_ERR_THREAD_CREATE (1048)

Could not create a thread. This error may occur if a large number of environments are created and not deleted again. In any case it is a good practice to minimize the number of environments created.

MSK_RES_ERR_THREAD_MUTEX_INIT (1045)

Could not initialize a mutex.

MSK_RES_ERR_THREAD_MUTEX_LOCK (1046)

Could not lock a mutex.

MSK_RES_ERR_THREAD_MUTEX_UNLOCK (1047)

Could not unlock a mutex.

MSK_RES_ERR_TOCONIC_CONSTR_NOT_CONIC (7153)

The constraint is not conic representable.

MSK_RES_ERR_TOCONIC_CONSTR_Q_NOT_PSD (7150)

The matrix defining the quadratic part of constraint is not positive semidefinite.

MSK_RES_ERR_TOCONIC_CONSTRAINT_FX (7151)

The quadratic constraint is an equality, thus not convex.

MSK_RES_ERR_TOCONIC_CONSTRAINT_RA (7152)

The quadratic constraint has finite lower and upper bound, and therefore it is not convex.

MSK_RES_ERR_TOCONIC_OBJECTIVE_NOT_PSD (7155)

The matrix defining the quadratic part of the objective function is not positive semidefinite.

MSK_RES_ERR_TOO_SMALL_MAX_NUM_NZ (1245)

The maximum number of non-zeros specified is too small.

MSK_RES_ERR_TOO_SMALL_MAXNUMANZ (1252)

The maximum number of non-zeros specified for A is smaller than the number of non-zeros in the current A .

MSK_RES_ERR_UNB_STEP_SIZE (3100)

A step size in an optimizer was unexpectedly unbounded. For instance, if the step-size becomes unbounded in phase 1 of the simplex algorithm then an error occurs. Normally this will happen only if the problem is badly formulated. Please contact **MOSEK** support if this error occurs.

MSK_RES_ERR_UNDEF_SOLUTION (1265)

MOSEK has the following solution types:

- an interior-point solution,
- an basic solution,
- and an integer solution.

Each optimizer may set one or more of these solutions; e.g by default a successful optimization with the interior-point optimizer defines the interior-point solution, and, for linear problems, also the basic solution. This error occurs when asking for a solution or for information about a solution that is not defined.

MSK_RES_ERR_UNDEFINED_OBJECTIVE_SENSE (1446)

The objective sense has not been specified before the optimization.

MSK_RES_ERR_UNHANDLED_SOLUTION_STATUS (6010)

Unhandled solution status.

MSK_RES_ERR_UNKNOWN (1050)

Unknown error.

MSK_RES_ERR_UPPER_BOUND_IS_A_NAN (1391)

The upper bound specified is not a number (nan).

MSK_RES_ERR_UPPER_TRIANGLE (6020)

An element in the upper triangle of a lower triangular matrix is specified.

MSK_RES_ERR_USER_FUNC_RET (1430)

An user function reported an error.

MSK_RES_ERR_USER_FUNC_RET_DATA (1431)

An user function returned invalid data.

MSK_RES_ERR_USER_NLO_EVAL (1433)

The user-defined nonlinear function reported an error.

MSK_RES_ERR_USER_NLO_EVAL_HESSUBI (1440)

The user-defined nonlinear function reported an invalid subscript in the Hessian.

MSK_RES_ERR_USER_NLO_EVAL_HESSUBJ (1441)

The user-defined nonlinear function reported an invalid subscript in the Hessian.

MSK_RES_ERR_USER_NLO_FUNC (1432)

The user-defined nonlinear function reported an error.

MSK_RES_ERR_WHICHITEM_NOT_ALLOWED (1238)

whichitem is unacceptable.

MSK_RES_ERR_WHICHSOL (1236)

The solution defined by *whichsol* does not exists.

MSK_RES_ERR_WRITE_LP_FORMAT (1158)

Problem cannot be written as an LP file.

MSK_RES_ERR_WRITE_LP_NON_UNIQUE_NAME (1161)

An auto-generated name is not unique.

MSK_RES_ERR_WRITE_MPS_INVALID_NAME (1153)

An invalid name is created while writing an MPS file. Usually this will make the MPS file unreadable.

MSK_RES_ERR_WRITE_OPF_INVALID_VAR_NAME (1156)

Empty variable names cannot be written to OPF files.

MSK_RES_ERR_WRITING_FILE (1166)

An error occurred while writing file

MSK_RES_ERR_XML_INVALID_PROBLEM_TYPE (3600)

The problem type is not supported by the XML format.

MSK_RES_ERR_Y_IS_UNDEFINED (1449)

The solution item y is undefined.

16.5.3 Warning Codes

MSK_RES_WRN_ANA_ALMOST_INT_BOUNDS (904)

This warning is issued by the problem analyzer if a constraint is bound nearly integral.

MSK_RES_WRN_ANA_C_ZERO (901)

This warning is issued by the problem analyzer, if the coefficients in the linear part of the objective are all zero.

MSK_RES_WRN_ANA_CLOSE_BOUNDS (903)

This warning is issued by problem analyzer, if ranged constraints or variables with very close upper and lower bounds are detected. One should consider treating such constraints as equalities and such variables as constants.

MSK_RES_WRN_ANA_EMPTY_COLS (902)

This warning is issued by the problem analyzer, if columns, in which all coefficients are zero, are found.

MSK_RES_WRN_ANA_LARGE_BOUNDS (900)

This warning is issued by the problem analyzer, if one or more constraint or variable bounds are very large. One should consider omitting these bounds entirely by setting them to $+\text{inf}$ or $-\text{inf}$.

MSK_RES_WRN_CONSTRUCT_INVALID_SOL_ITG (807)

The initial value for one or more of the integer variables is not feasible.

MSK_RES_WRN_CONSTRUCT_NO_SOL_ITG (810)

The construct solution requires an integer solution.

MSK_RES_WRN_CONSTRUCT_SOLUTION_INFEAS (805)

After fixing the integer variables at the suggested values then the problem is infeasible.

MSK_RES_WRN_DROPPED_NZ_QOBJ (201)

One or more non-zero elements were dropped in the Q matrix in the objective.

MSK_RES_WRN_DUPLICATE_BARVARIABLE_NAMES (852)

Two barvariable names are identical.

MSK_RES_WRN_DUPLICATE_CONE_NAMES (853)

Two cone names are identical.

MSK_RES_WRN_DUPLICATE_CONSTRAINT_NAMES (850)

Two constraint names are identical.

MSK_RES_WRN_DUPLICATE_VARIABLE_NAMES (851)

Two variable names are identical.

MSK_RES_WRN_ELIMINATOR_SPACE (801)

The eliminator is skipped at least once due to lack of space.

MSK_RES_WRN_EMPTY_NAME (502)

A variable or constraint name is empty. The output file may be invalid.

MSK_RES_WRN_IGNORE_INTEGER (250)

Ignored integer constraints.

MSK_RES_WRN_INCOMPLETE_LINEAR_DEPENDENCY_CHECK (800)

The linear dependency check(s) is incomplete. Normally this is not an important warning unless the optimization problem has been formulated with linear dependencies. Linear dependencies may prevent **MOSEK** from solving the problem.

MSK_RES_WRN_LARGE_AIJ (62)

A numerically large value is specified for an $a_{i,j}$ element in A . The parameter `MSK_DPAR_DATA_TOL_AIJ_LARGE` controls when an $a_{i,j}$ is considered large.

- MSK_RES_WRN_LARGE_BOUND (51)
A numerically large bound value is specified.
- MSK_RES_WRN_LARGE_CJ (57)
A numerically large value is specified for one c_j .
- MSK_RES_WRN_LARGE_CON_FX (54)
An equality constraint is fixed to a numerically large value. This can cause numerical problems.
- MSK_RES_WRN_LARGE_LO_BOUND (52)
A numerically large lower bound value is specified.
- MSK_RES_WRN_LARGE_UP_BOUND (53)
A numerically large upper bound value is specified.
- MSK_RES_WRN_LICENSE_EXPIRE (500)
The license expires.
- MSK_RES_WRN_LICENSE_FEATURE_EXPIRE (505)
The license expires.
- MSK_RES_WRN_LICENSE_SERVER (501)
The license server is not responding.
- MSK_RES_WRN_LP_DROP_VARIABLE (85)
Ignored a variable because the variable was not previously defined. Usually this implies that a variable appears in the bound section but not in the objective or the constraints.
- MSK_RES_WRN_LP_OLD_QUAD_FORMAT (80)
Missing $\prime/2\prime$ after quadratic expressions in bound or objective.
- MSK_RES_WRN_MIO_INFEASIBLE_FINAL (270)
The final mixed-integer problem with all the integer variables fixed at their optimal values is infeasible.
- MSK_RES_WRN_MPS_SPLIT_BOU_VECTOR (72)
A BOUNDS vector is split into several nonadjacent parts in an MPS file.
- MSK_RES_WRN_MPS_SPLIT_RAN_VECTOR (71)
A RANGE vector is split into several nonadjacent parts in an MPS file.
- MSK_RES_WRN_MPS_SPLIT_RHS_VECTOR (70)
An RHS vector is split into several nonadjacent parts in an MPS file.
- MSK_RES_WRN_NAME_MAX_LEN (65)
A name is longer than the buffer that is supposed to hold it.
- MSK_RES_WRN_NO_DUALIZER (950)
No automatic dualizer is available for the specified problem. The primal problem is solved.
- MSK_RES_WRN_NO_GLOBAL_OPTIMIZER (251)
No global optimizer is available.
- MSK_RES_WRN_NO_NONLINEAR_FUNCTION_WRITE (450)
The problem contains a general nonlinear function in either the objective or the constraints. Such a nonlinear function cannot be written to a disk file. Note that quadratic terms when inputted explicitly can be written to disk.
- MSK_RES_WRN_NZ_IN_UPR_TRI (200)
Non-zero elements specified in the upper triangle of a matrix were ignored.
- MSK_RES_WRN_OPEN_PARAM_FILE (50)
The parameter file could not be opened.
- MSK_RES_WRN_PARAM_IGNORED_CMIO (516)
A parameter was ignored by the conic mixed integer optimizer.
- MSK_RES_WRN_PARAM_NAME_DOU (510)
The parameter name is not recognized as a double parameter.

MSK_RES_WRN_PARAM_NAME_INT (511)

The parameter name is not recognized as a integer parameter.

MSK_RES_WRN_PARAM_NAME_STR (512)

The parameter name is not recognized as a string parameter.

MSK_RES_WRN_PARAM_STR_VALUE (515)

The string is not recognized as a symbolic value for the parameter.

MSK_RES_WRN_PRESOLVE_OUTOFSPACE (802)

The presolve is incomplete due to lack of space.

MSK_RES_WRN_QUAD_CONES_WITH_ROOT_FIXED_AT_ZERO (930)

For at least one quadratic cone the root is fixed at (nearly) zero. This may cause problems such as a very large dual solution. Therefore, it is recommended to remove such cones before optimizing the problems, or to fix all the variables in the cone to 0.

MSK_RES_WRN_RQUAD_CONES_WITH_ROOT_FIXED_AT_ZERO (931)

For at least one rotated quadratic cone at least one of the root variables are fixed at (nearly) zero. This may cause problems such as a very large dual solution. Therefore, it is recommended to remove such cones before optimizing the problems, or to fix all the variables in the cone to 0.

MSK_RES_WRN_SOL_FILE_IGNORED_CON (351)

One or more lines in the constraint section were ignored when reading a solution file.

MSK_RES_WRN_SOL_FILE_IGNORED_VAR (352)

One or more lines in the variable section were ignored when reading a solution file.

MSK_RES_WRN_SOL_FILTER (300)

Invalid solution filter is specified.

MSK_RES_WRN_SPAR_MAX_LEN (66)

A value for a string parameter is longer than the buffer that is supposed to hold it.

MSK_RES_WRN_SYM_MAT_LARGE (960)

A numerically large value is specified for an $e_{i,j}$ element in E . The parameter `MSK_DPAR_DATA_SYM_MAT_TOL_LARGE` controls when an $e_{i,j}$ is considered large.

MSK_RES_WRN_TOO_FEW_BASIS_VARS (400)

An incomplete basis has been specified. Too few basis variables are specified.

MSK_RES_WRN_TOO_MANY_BASIS_VARS (405)

A basis with too many variables has been specified.

MSK_RES_WRN_UNDEF_SOL_FILE_NAME (350)

Undefined name occurred in a solution.

MSK_RES_WRN_USING_GENERIC_NAMES (503)

Generic names are used because a name is not valid. For instance when writing an LP file the names must not contain blanks or start with a digit.

MSK_RES_WRN_WRITE_CHANGED_NAMES (803)

Some names were changed because they were invalid for the output file format.

MSK_RES_WRN_WRITE_DISCARDED_CFIX (804)

The fixed objective term could not be converted to a variable and was discarded in the output file.

MSK_RES_WRN_ZERO_AIJ (63)

One or more zero elements are specified in A.

MSK_RES_WRN_ZEROS_IN_SPARSE_COL (710)

One or more (near) zero elements are specified in a sparse column of a matrix. It is redundant to specify zero elements. Hence, it may indicate an error.

MSK_RES_WRN_ZEROS_IN_SPARSE_ROW (705)

One or more (near) zero elements are specified in a sparse row of a matrix. Since, it is redundant to specify zero elements then it may indicate an error.

16.6 Enumerations

MSKlanguagee

Language selection constants

MSK_LANG_ENG

English language selection

MSK_LANG_DAN

Danish language selection

MSKaccmodee

Constraint or variable access modes

MSK_ACC_VAR

Access data by columns (variable oriented)

MSK_ACC_CON

Access data by rows (constraint oriented)

MSKbasindtypee

Basis identification

MSK_BI_NEVER

Never do basis identification.

MSK_BI_ALWAYS

Basis identification is always performed even if the interior-point optimizer terminates abnormally.

MSK_BI_NO_ERROR

Basis identification is performed if the interior-point optimizer terminates without an error.

MSK_BI_IF_FEASIBLE

Basis identification is not performed if the interior-point optimizer terminates with a problem status saying that the problem is primal or dual infeasible.

MSK_BI_RESERVED

Not currently in use.

MSKboundkeye

Bound keys

MSK_BK_LO

The constraint or variable has a finite lower bound and an infinite upper bound.

MSK_BK_UP

The constraint or variable has an infinite lower bound and a finite upper bound.

MSK_BK_FX

The constraint or variable is fixed.

MSK_BK_FR

The constraint or variable is free.

MSK_BK_RA

The constraint or variable is ranged.

MSKmarke

Mark

MSK_MARK_LO

The lower bound is selected for sensitivity analysis.

MSK_MARK_UP

The upper bound is selected for sensitivity analysis.

MSKsimdegene

Degeneracy strategies

MSK_SIM_DEGEN_NONE

The simplex optimizer should use no degeneration strategy.

MSK_SIM_DEGEN_FREE

The simplex optimizer chooses the degeneration strategy.

MSK_SIM_DEGEN_AGGRESSIVE

The simplex optimizer should use an aggressive degeneration strategy.

MSK_SIM_DEGEN_MODERATE

The simplex optimizer should use a moderate degeneration strategy.

MSK_SIM_DEGEN_MINIMUM

The simplex optimizer should use a minimum degeneration strategy.

MSKtransposee

Transposed matrix.

MSK_TRANSPOSE_NO

No transpose is applied.

MSK_TRANSPOSE_YES

A transpose is applied.

MSKuploe

Triangular part of a symmetric matrix.

MSK_UPLO_LO

Lower part.

MSK_UPLO_UP

Upper part

MSKsimreforme

Problem reformulation.

MSK_SIM_REFORMULATION_ON

Allow the simplex optimizer to reformulate the problem.

MSK_SIM_REFORMULATION_OFF

Disallow the simplex optimizer to reformulate the problem.

MSK_SIM_REFORMULATION_FREE

The simplex optimizer can choose freely.

MSK_SIM_REFORMULATION_AGGRESSIVE

The simplex optimizer should use an aggressive reformulation strategy.

MSKsimdupvece

Exploit duplicate columns.

MSK_SIM_EXPLOIT_DUPVEC_ON

Allow the simplex optimizer to exploit duplicated columns.

MSK_SIM_EXPLOIT_DUPVEC_OFF

Disallow the simplex optimizer to exploit duplicated columns.

MSK_SIM_EXPLOIT_DUPVEC_FREE

The simplex optimizer can choose freely.

MSKsimhotstarte

Hot-start type employed by the simplex optimizer

MSK_SIM_HOTSTART_NONE

The simplex optimizer performs a coldstart.

MSK_SIM_HOTSTART_FREE

The simplex optimizer chooses the hot-start type.

MSK_SIM_HOTSTART_STATUS_KEYS

Only the status keys of the constraints and variables are used to choose the type of hot-start.

MSKintpnthotstarte

Hot-start type employed by the interior-point optimizers.

MSK_INTPNT_HOTSTART_NONE

The interior-point optimizer performs a coldstart.

MSK_INTPNT_HOTSTART_PRIMAL

The interior-point optimizer exploits the primal solution only.

MSK_INTPNT_HOTSTART_DUAL

The interior-point optimizer exploits the dual solution only.

MSK_INTPNT_HOTSTART_PRIMAL_DUAL

The interior-point optimizer exploits both the primal and dual solution.

MSKcallbackcodee

Progress call-back codes

MSK_CALLBACK_BEGIN_ROOT_CUTGEN

The call-back function is called when root cut generation is started.

MSK_CALLBACK_IM_ROOT_CUTGEN

The call-back is called from within root cut generation at an intermediate stage.

MSK_CALLBACK_END_ROOT_CUTGEN

The call-back function is called when root cut generation is terminated.

MSK_CALLBACK_BEGIN_OPTIMIZER

The call-back function is called when the optimizer is started.

MSK_CALLBACK_END_OPTIMIZER

The call-back function is called when the optimizer is terminated.

MSK_CALLBACK_BEGIN PRESOLVE

The call-back function is called when the presolve is started.

MSK_CALLBACK_UPDATE PRESOLVE

The call-back function is called from within the presolve procedure.

MSK_CALLBACK_IM PRESOLVE

The call-back function is called from within the presolve procedure at an intermediate stage.

MSK_CALLBACK_END PRESOLVE

The call-back function is called when the presolve is completed.

MSK_CALLBACK_BEGIN_INTPNT

The call-back function is called when the interior-point optimizer is started.

MSK_CALLBACK_INTPNT

The call-back function is called from within the interior-point optimizer after the information database has been updated.

MSK_CALLBACK_IM_INTPNT

The call-back function is called at an intermediate stage within the interior-point optimizer where the information database has not been updated.

MSK_CALLBACK_END_INTPNT

The call-back function is called when the interior-point optimizer is terminated.

MSK_CALLBACK_BEGIN CONIC

The call-back function is called when the conic optimizer is started.

MSK_CALLBACK_CONIC

The call-back function is called from within the conic optimizer after the information database has been updated.

MSK_CALLBACK_IM_CONIC

The call-back function is called at an intermediate stage within the conic optimizer where the information database has not been updated.

MSK_CALLBACK_END_CONIC

The call-back function is called when the conic optimizer is terminated.

MSK_CALLBACK_PRIMAL_SIMPLEX

The call-back function is called from within the primal simplex optimizer.

MSK_CALLBACK_DUAL_SIMPLEX

The call-back function is called from within the dual simplex optimizer.

MSK_CALLBACK_BEGIN_BI

The basis identification procedure has been started.

MSK_CALLBACK_IM_BI

The call-back function is called from within the basis identification procedure at an intermediate point.

MSK_CALLBACK_END_BI

The call-back function is called when the basis identification procedure is terminated.

MSK_CALLBACK_BEGIN_PRIMAL_BI

The call-back function is called from within the basis identification procedure when the primal phase is started.

MSK_CALLBACK_IM_PRIMAL_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the primal phase.

MSK_CALLBACK_UPDATE_PRIMAL_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the primal phase.

MSK_CALLBACK_END_PRIMAL_BI

The call-back function is called from within the basis identification procedure when the primal phase is terminated.

MSK_CALLBACK_BEGIN_DUAL_BI

The call-back function is called from within the basis identification procedure when the dual phase is started.

MSK_CALLBACK_IM_DUAL_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the dual phase.

MSK_CALLBACK_UPDATE_DUAL_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the dual phase.

MSK_CALLBACK_END_DUAL_BI

The call-back function is called from within the basis identification procedure when the dual phase is terminated.

MSK_CALLBACK_BEGIN_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the simplex clean-up phase is started.

MSK_CALLBACK_IM_SIMPLEX_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the simplex clean-up phase. The frequency of the call-backs is controlled by the *MSK_IPAR_LOG_SIM_FREQ* parameter.

MSK_CALLBACK_BEGIN_PRIMAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the primal simplex clean-up phase is started.

MSK_CALLBACK_UPDATE_PRIMAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the primal simplex clean-up phase. The frequency of the call-backs is controlled by the *MSK_IPAR_LOG_SIM_FREQ* parameter.

MSK_CALLBACK_END_PRIMAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the primal clean-up phase is terminated.

MSK_CALLBACK_BEGIN_PRIMAL_DUAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the primal-dual simplex clean-up phase is started.

MSK_CALLBACK_UPDATE_PRIMAL_DUAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the primal-dual simplex clean-up phase. The frequency of the call-backs is controlled by the *MSK_IPAR_LOG_SIM_FREQ* parameter.

MSK_CALLBACK_END_PRIMAL_DUAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the primal-dual clean-up phase is terminated.

MSK_CALLBACK_BEGIN_DUAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the dual simplex clean-up phase is started.

MSK_CALLBACK_UPDATE_DUAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure at an intermediate point in the dual simplex clean-up phase. The frequency of the call-backs is controlled by the *MSK_IPAR_LOG_SIM_FREQ* parameter.

MSK_CALLBACK_END_DUAL_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the dual clean-up phase is terminated.

MSK_CALLBACK_END_SIMPLEX_BI

The call-back function is called from within the basis identification procedure when the simplex clean-up phase is terminated.

MSK_CALLBACK_BEGIN_MIO

The call-back function is called when the mixed-integer optimizer is started.

MSK_CALLBACK_IM_MIO

The call-back function is called at an intermediate point in the mixed-integer optimizer.

MSK_CALLBACK_NEW_INT_MIO

The call-back function is called after a new integer solution has been located by the mixed-integer optimizer.

MSK_CALLBACK_END_MIO

The call-back function is called when the mixed-integer optimizer is terminated.

MSK_CALLBACK_BEGIN_SIMPLEX

The call-back function is called when the simplex optimizer is started.

MSK_CALLBACK_BEGIN_DUAL_SIMPLEX

The call-back function is called when the dual simplex optimizer started.

MSK_CALLBACK_IM_DUAL_SIMPLEX

The call-back function is called at an intermediate point in the dual simplex optimizer.

MSK_CALLBACK_UPDATE_DUAL_SIMPLEX

The call-back function is called in the dual simplex optimizer.

MSK_CALLBACK_END_DUAL_SIMPLEX

The call-back function is called when the dual simplex optimizer is terminated.

MSK_CALLBACK_BEGIN_PRIMAL_SIMPLEX

The call-back function is called when the primal simplex optimizer is started.

MSK_CALLBACK_IM_PRIMAL_SIMPLEX

The call-back function is called at an intermediate point in the primal simplex optimizer.

MSK_CALLBACK_UPDATE_PRIMAL_SIMPLEX

The call-back function is called in the primal simplex optimizer.

MSK_CALLBACK_END_PRIMAL_SIMPLEX

The call-back function is called when the primal simplex optimizer is terminated.

MSK_CALLBACK_BEGIN_PRIMAL_DUAL_SIMPLEX

The call-back function is called when the primal-dual simplex optimizer is started.

MSK_CALLBACK_IM_PRIMAL_DUAL_SIMPLEX

The call-back function is called at an intermediate point in the primal-dual simplex optimizer.

MSK_CALLBACK_UPDATE_PRIMAL_DUAL_SIMPLEX

The call-back function is called in the primal-dual simplex optimizer.

MSK_CALLBACK_END_PRIMAL_DUAL_SIMPLEX

The call-back function is called when the primal-dual simplex optimizer is terminated.

MSK_CALLBACK_END_SIMPLEX

The call-back function is called when the simplex optimizer is terminated.

MSK_CALLBACK_BEGIN_INFEAS_ANA

The call-back function is called when the infeasibility analyzer is started.

MSK_CALLBACK_END_INFEAS_ANA

The call-back function is called when the infeasibility analyzer is terminated.

MSK_CALLBACK_IM_PRIMAL_SENSIVITY

The call-back function is called at an intermediate stage of the primal sensitivity analysis.

MSK_CALLBACK_IM_DUAL_SENSIVITY

The call-back function is called at an intermediate stage of the dual sensitivity analysis.

MSK_CALLBACK_IM_MIO_INTPNT

The call-back function is called at an intermediate point in the mixed-integer optimizer while running the interior-point optimizer.

MSK_CALLBACK_IM_MIO_PRIMAL_SIMPLEX

The call-back function is called at an intermediate point in the mixed-integer optimizer while running the primal simplex optimizer.

MSK_CALLBACK_IM_MIO_DUAL_SIMPLEX

The call-back function is called at an intermediate point in the mixed-integer optimizer while running the dual simplex optimizer.

MSK_CALLBACK_BEGIN_PRIMAL_SETUP_BI

The call-back function is called when the primal BI setup is started.

MSK_CALLBACK_END_PRIMAL_SETUP_BI

The call-back function is called when the primal BI setup is terminated.

MSK_CALLBACK_BEGIN_DUAL_SETUP_BI

The call-back function is called when the dual BI phase is started.

MSK_CALLBACK_END_DUAL_SETUP_BI

The call-back function is called when the dual BI phase is terminated.

MSK_CALLBACK_BEGIN_PRIMAL_SENSITIVITY

Primal sensitivity analysis is started.

MSK_CALLBACK_END_PRIMAL_SENSITIVITY
 Primal sensitivity analysis is terminated.

MSK_CALLBACK_BEGIN_DUAL_SENSITIVITY
 Dual sensitivity analysis is started.

MSK_CALLBACK_END_DUAL_SENSITIVITY
 Dual sensitivity analysis is terminated.

MSK_CALLBACK_BEGIN_LICENSE_WAIT
 Begin waiting for license.

MSK_CALLBACK_END_LICENSE_WAIT
 End waiting for license.

MSK_CALLBACK_IM_LICENSE_WAIT
MOSEK is waiting for a license.

MSK_CALLBACK_BEGIN_QCQO_REFORMULATE
 Begin QCQO reformulation.

MSK_CALLBACK_END_QCQO_REFORMULATE
 End QCQO reformulation.

MSK_CALLBACK_IM_QO_REFORMULATE
 The call-back function is called at an intermediate stage of the conic quadratic reformulation.

MSK_CALLBACK_BEGIN_TO_CONIC
 Begin conic reformulation.

MSK_CALLBACK_END_TO_CONIC
 End conic reformulation.

MSK_CALLBACK_BEGIN_FULL_CONVEXITY_CHECK
 Begin full convexity check.

MSK_CALLBACK_END_FULL_CONVEXITY_CHECK
 End full convexity check.

MSK_CALLBACK_IM_FULL_CONVEXITY_CHECK
 The call-back function is called at an intermediate stage of the full convexity check.

MSK_CALLBACK_BEGIN_PRIMAL_REPAIR
 Begin primal feasibility repair.

MSK_CALLBACK_END_PRIMAL_REPAIR
 End primal feasibility repair.

MSK_CALLBACK_BEGIN_READ
MOSEK has started reading a problem file.

MSK_CALLBACK_IM_READ
 Intermediate stage in reading.

MSK_CALLBACK_END_READ
MOSEK has finished reading a problem file.

MSK_CALLBACK_BEGIN_WRITE
MOSEK has started writing a problem file.

MSK_CALLBACK_END_WRITE
MOSEK has finished writing a problem file.

MSK_CALLBACK_READ_OPF_SECTION
 A chunk of Q non-zeros has been read from a problem file.

MSK_CALLBACK_IM_LU
 The call-back function is called from within the LU factorization procedure at an intermediate point.

MSK_CALLBACK_IM_ORDER

The call-back function is called from within the matrix ordering procedure at an intermediate point.

MSK_CALLBACK_IM_SIMPLEX

The call-back function is called from within the simplex optimizer at an intermediate point.

MSK_CALLBACK_READ_OPF

The call-back function is called from the OPF reader.

MSK_CALLBACK_WRITE_OPF

The call-back function is called from the OPF writer.

MSK_CALLBACK_SOLVING_REMOTE

The call-back function is called while the task is being solved on a remote server.

MSKcheckconvexitytypee

Types of convexity checks.

MSK_CHECK_CONVEXITY_NONE

No convexity check.

MSK_CHECK_CONVEXITY_SIMPLE

Perform simple and fast convexity check.

MSK_CHECK_CONVEXITY_FULL

Perform a full convexity check.

MSKcompresstypee

Compression types

MSK_COMPRESS_NONE

No compression is used.

MSK_COMPRESS_FREE

The type of compression used is chosen automatically.

MSK_COMPRESS_GZIP

The type of compression used is gzip compatible.

MSKconetypee

Cone types

MSK_CT_QUAD

The cone is a quadratic cone.

MSK_CT_RQUAD

The cone is a rotated quadratic cone.

MSKnametypee

Name types

MSK_NAME_TYPE_GEN

General names. However, no duplicate and blank names are allowed.

MSK_NAME_TYPE_MPS

MPS type names.

MSK_NAME_TYPE_LP

LP type names.

MSKsymmattypee

Cone types

MSK_SYMMAT_TYPE_SPARSE

Sparse symmetric matrix.

MSKdataformate

Data format types

MSK_DATA_FORMAT_EXTENSION

The file extension is used to determine the data file format.

MSK_DATA_FORMAT_MPS

The data file is MPS formatted.

MSK_DATA_FORMAT_LP

The data file is LP formatted.

MSK_DATA_FORMAT_OP

The data file is an optimization problem formatted file.

MSK_DATA_FORMAT_XML

The data file is an XML formatted file.

MSK_DATA_FORMAT_FREE_MPS

The data a free MPS formatted file.

MSK_DATA_FORMAT_TASK

Generic task dump file.

MSK_DATA_FORMAT_CB

Conic benchmark format,

MSK_DATA_FORMAT_JSON_TASK

JSON based task format.

MSKdinfiteme

Double information items

MSK_DINF_BI_TIME

Time spent within the basis identification procedure since its invocation.

MSK_DINF_BI_PRIMAL_TIME

Time spent within the primal phase of the basis identification procedure since its invocation.

MSK_DINF_BI_DUAL_TIME

Time spent within the dual phase basis identification procedure since its invocation.

MSK_DINF_BI_CLEAN_TIME

Time spent within the clean-up phase of the basis identification procedure since its invocation.

MSK_DINF_BI_CLEAN_PRIMAL_TIME

Time spent within the primal clean-up optimizer of the basis identification procedure since its invocation.

MSK_DINF_BI_CLEAN_PRIMAL_DUAL_TIME

Time spent within the primal-dual clean-up optimizer of the basis identification procedure since its invocation.

MSK_DINF_BI_CLEAN_DUAL_TIME

Time spent within the dual clean-up optimizer of the basis identification procedure since its invocation.

MSK_DINF_INTPNT_TIME

Time spent within the interior-point optimizer since its invocation.

MSK_DINF_INTPNT_ORDER_TIME

Order time (in seconds).

MSK_DINF_INTPNT_PRIMAL_OBJ

Primal objective value reported by the interior-point optimizer.

MSK_DINF_INTPNT_DUAL_OBJ

Dual objective value reported by the interior-point optimizer.

MSK_DINF_INTPNT_PRIMAL_FEAS

Primal feasibility measure reported by the interior-point optimizers. (For the interior-point

optimizer this measure does not directly related to the original problem because a homogeneous model is employed).

MSK_DINF_INTPNT_DUAL_FEAS

Dual feasibility measure reported by the interior-point optimizer. (For the interior-point optimizer this measure does not directly related to the original problem because a homogeneous model is employed.)

MSK_DINF_INTPNT_OPT_STATUS

This measure should converge to +1 if the problem has a primal-dual optimal solution, and converge to -1 if problem is (strictly) primal or dual infeasible. If the measure converges to another constant, or fails to settle, the problem is usually ill-posed.

MSK_DINF_SIM_TIME

Time spent in the simplex optimizer since invoking it.

MSK_DINF_SIM_PRIMAL_TIME

Time spent in the primal simplex optimizer since invoking it.

MSK_DINF_SIM_DUAL_TIME

Time spent in the dual simplex optimizer since invoking it.

MSK_DINF_SIM_PRIMAL_DUAL_TIME

Time spent in the primal-dual simplex optimizer since invoking it.

MSK_DINF_SIM_OBJ

Objective value reported by the simplex optimizer.

MSK_DINF_SIM_FEAS

Feasibility measure reported by the simplex optimizer.

MSK_DINF_MIO_TIME

Time spent in the mixed-integer optimizer.

MSK_DINF_MIO_ROOT PRESOLVE_TIME

Time spent in while presolving the root relaxation.

MSK_DINF_MIO_ROOT_OPTIMIZER_TIME

Time spent in the optimizer while solving the root relaxation.

MSK_DINF_MIO_OPTIMIZER_TIME

Total time spent in the optimizer.

MSK_DINF_MIO_HEURISTIC_TIME

Total time spent in the optimizer.

MSK_DINF_TO_CONIC_TIME

Time spent in the last to conic reformulation.

MSK_DINF_MIO_CONSTRUCT_SOLUTION_OBJ

If **MOSEK** has successfully constructed an integer feasible solution, then this item contains the optimal objective value corresponding to the feasible solution.

MSK_DINF_MIO_OBJ_INT

The primal objective value corresponding to the best integer feasible solution. Please note that at least one integer feasible solution must have located i.e. check | [*MSK_IINF_MIO_NUM_INT_SOLUTIONS*](#) |.

MSK_DINF_MIO_OBJ_BOUND

The best known bound on the objective function. This value is undefined until at least one relaxation has been solved: To see if this is the case check that | [*MSK_IINF_MIO_NUM_RELAX*](#) | is strictly positive.

MSK_DINF_MIO_OBJ_REL_GAP

Given that the mixed-integer optimizer has computed a feasible solution and a bound on the

optimal objective value, then this item contains the relative gap defined by

$$\frac{|(\text{objective value of feasible solution}) - (\text{objective bound})|}{\max(\delta, |(\text{objective value of feasible solution})|)}.$$

where δ is given by the parameter `MSK_DPAR_MIO_REL_GAP_CONST`. Otherwise it has the value -1.0 .

MSK_DINF_MIO_OBJ_ABS_GAP

Given the mixed-integer optimizer has computed a feasible solution and a bound on the optimal objective value, then this item contains the absolute gap defined by

$$|(\text{objective value of feasible solution}) - (\text{objective bound})|.$$

Otherwise it has the value -1.0 .

MSK_DINF_MIO_USER_OBJ_CUT

If the objective cut is used, then this information item has the value of the cut.

MSK_DINF_MIO_CMIR_SEPARATION_TIME

Seperation time for CMIR cuts.

MSK_DINF_MIO_CLIQUE_SEPARATION_TIME

Seperation time for clique cuts.

MSK_DINF_MIO_KNAPSACK_COVER_SEPARATION_TIME

Seperation time for knapsack cover.

MSK_DINF_MIO_GMI_SEPARATION_TIME

Seperation time for GMI cuts.

MSK_DINF_MIO_IMPLIED_BOUND_TIME

Seperation time for implied bound cuts.

MSK_DINF_MIO_ROOT_CUTGEN_TIME

Total time for cut generation.

MSK_DINF_MIO_PROBING_TIME

Total time for probing.

MSK_DINF_OPTIMIZER_TIME

Total time spent in the optimizer since it was invoked.

MSK_DINF_PRESOLVE_TIME

Total time (in seconds) spent in the presolve since it was invoked.

MSK_DINF_MIO_DUAL_BOUND_AFTER_PRESOLVE

Value of the dual bound after presolve but before cut generation.

MSK_DINF_PRESOLVE_ELI_TIME

Total time spent in the eliminator since the presolve was invoked.

MSK_DINF_PRESOLVE_LINDEP_TIME

Total time spent in the linear dependency checker since the presolve was invoked.

MSK_DINF_RD_TIME

Time spent reading the data file.

MSK_DINF_SOL_ITR_PRIMAL_OBJ

Primal objective value of the interior-point solution.

MSK_DINF_SOL_ITR_PVIOLCON

Maximal primal bound violation for x^c in the interior-point solution.

MSK_DINF_SOL_ITR_PVIOLVAR

Maximal primal bound violation for x^x in the interior-point solution.

MSK_DINF_SOL_ITR_PVIOLBARVAR

Maximal primal bound violation for \overline{X} in the interior-point solution.

MSK_DINF_SOL_ITR_PVIOLCONES
Maximal primal violation for primal conic constraints in the interior-point solution.

MSK_DINF_SOL_ITR_DUAL_OBJ
Dual objective value of the interior-point solution.

MSK_DINF_SOL_ITR_DVIOLCON
Maximal dual bound violation for x^c in the interior-point solution.

MSK_DINF_SOL_ITR_DVIOLVAR
Maximal dual bound violation for x^x in the interior-point solution.

MSK_DINF_SOL_ITR_DVIOLBARVAR
Maximal dual bound violation for \bar{X} in the interior-point solution.

MSK_DINF_SOL_ITR_DVIOLCONES
Maximal dual violation for dual conic constraints in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_XC
Infinity norm of x^c in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_XX
Infinity norm of x^x in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_BARX
Infinity norm of \bar{X} in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_Y
Infinity norm of y in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_SLC
Infinity norm of s_l^c in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_SUC
Infinity norm of s_u^c in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_SLX
Infinity norm of s_l^x in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_SUX
Infinity norm of s_u^X in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_SNX
Infinity norm of s_n^x in the interior-point solution.

MSK_DINF_SOL_ITR_NRM_BARS
Infinity norm of \bar{S} in the interior-point solution.

MSK_DINF_SOL_BAS_PRIMAL_OBJ
Primal objective value of the basic solution.

MSK_DINF_SOL_BAS_PVIOLCON
Maximal primal bound violation for x^c in the basic solution.

MSK_DINF_SOL_BAS_PVIOLVAR
Maximal primal bound violation for x^x in the basic solution.

MSK_DINF_SOL_BAS_DUAL_OBJ
Dual objective value of the basic solution.

MSK_DINF_SOL_BAS_DVIOLCON
Maximal dual bound violation for x^c in the basic solution.

MSK_DINF_SOL_BAS_DVIOLVAR
Maximal dual bound violation for x^x in the basic solution.

MSK_DINF_SOL_BAS_NRM_XC
Infinity norm of x^c in the basic solution.

MSK_DINF_SOL_BAS_NRM_XX	Infinity norm of x^x in the basic solution.
MSK_DINF_SOL_BAS_NRM_BARX	Infinity norm of \bar{X} in the basic solution.
MSK_DINF_SOL_BAS_NRM_Y	Infinity norm of y in the basic solution.
MSK_DINF_SOL_BAS_NRM_SLC	Infinity norm of s_l^c in the basic solution.
MSK_DINF_SOL_BAS_NRM_SUC	Infinity norm of s_u^c in the basic solution.
MSK_DINF_SOL_BAS_NRM_SLX	Infinity norm of s_l^x in the basic solution.
MSK_DINF_SOL_BAS_NRM_SUX	Infinity norm of s_u^X in the basic solution.
MSK_DINF_SOL_ITG_PRIMAL_OBJ	Primal objective value of the integer solution.
MSK_DINF_SOL_ITG_PVIOLCON	Maximal primal bound violation for x^c in the integer solution.
MSK_DINF_SOL_ITG_PVIOLVAR	Maximal primal bound violation for x^x in the integer solution.
MSK_DINF_SOL_ITG_PVIOLBARVAR	Maximal primal bound violation for \bar{X} in the integer solution.
MSK_DINF_SOL_ITG_PVIOLCONES	Maximal primal violation for primal conic constraints in the integer solution.
MSK_DINF_SOL_ITG_PVIOLITG	Maximal violation for the integer constraints in the integer solution.
MSK_DINF_SOL_ITG_NRM_XC	Infinity norm of x^c in the integer solution.
MSK_DINF_SOL_ITG_NRM_XX	Infinity norm of x^x in the integer solution.
MSK_DINF_SOL_ITG_NRM_BARX	Infinity norm of \bar{X} in the integer solution.
MSK_DINF_INTPNT_FACTOR_NUM_FLOPS	An estimate of the number of flops used in the factorization.
MSK_DINF_QCQO_REFORMULATE_TIME	Time spent with conic quadratic reformulation.
MSK_DINF_QCQO_REFORMULATE_MAX_PERTURBATION	Maximum absolute diagonal perturbation occurring during the QCQO reformulation.
MSK_DINF_QCQO_REFORMULATE_WORST_CHOLESKY_DIAG_SCALING	Worst Cholesky diagonal scaling.
MSK_DINF_QCQO_REFORMULATE_WORST_CHOLESKY_COLUMN_SCALING	Worst Cholesky column scaling.
MSK_DINF_PRIMAL_REPAIR_PENALTY_OBJ	The optimal objective value of the penalty function.
MSKfeaturee	License feature

MSK_FEATURE_PTS

Base system.

MSK_FEATURE_PTON

Nonlinear extension.

MSKliinfiteme

Long integer information items.

MSK_LIINF_MIO_PRE SOLVED_ ANZ

Number of non-zero entries in the constraint matrix of presolved problem.

MSK_LIINF_MIO_SIMPLEX_ITER

Number of simplex iterations performed by the mixed-integer optimizer.

MSK_LIINF_MIO_INTPNT_ITER

Number of interior-point iterations performed by the mixed-integer optimizer.

MSK_LIINF_BI_PRIMAL_ITER

Number of primal pivots performed in the basis identification.

MSK_LIINF_BI_DUAL_ITER

Number of dual pivots performed in the basis identification.

MSK_LIINF_BI_CLEAN_PRIMAL_ITER

Number of primal clean iterations performed in the basis identification.

MSK_LIINF_BI_CLEAN_PRIMAL_DUAL_ITER

Number of primal-dual clean iterations performed in the basis identification.

MSK_LIINF_BI_CLEAN_DUAL_ITER

Number of dual clean iterations performed in the basis identification.

MSK_LIINF_BI_CLEAN_PRIMAL_DEG_ITER

Number of primal degenerate clean iterations performed in the basis identification.

MSK_LIINF_BI_CLEAN_PRIMAL_DUAL_SUB_ITER

Number of primal-dual subproblem clean iterations performed in the basis identification.

MSK_LIINF_BI_CLEAN_PRIMAL_DUAL_DEG_ITER

Number of primal-dual degenerate clean iterations performed in the basis identification.

MSK_LIINF_BI_CLEAN_DUAL_DEG_ITER

Number of dual degenerate clean iterations performed in the basis identification.

MSK_LIINF_INTPNT_FACTOR_NUM_NZ

Number of non-zeros in factorization.

MSK_LIINF_RD_NUMANZ

Number of non-zeros in A that is read.

MSK_LIINF_RD_NUMQNZ

Number of Q non-zeros.

MSK_LIINF_MIO_SIM_MAXITER_SETBACKS

Number of times the the simplex optimizer has hit the maximum iteration limit when re-optimizing.

MSKiinfiteme

Integer information items.

MSK_IINF_ANA_PRO_NUM_CON

Number of constraints in the problem.

This value is set by *task.analyzeproblem*.

MSK_IINF_ANA_PRO_NUM_CON_LO

Number of constraints with a lower bound and an infinite upper bound.

This value is set by *task.analyzeproblem*.

- MSK_IINF_ANA_PRO_NUM_CON_UP**
 Number of constraints with an upper bound and an infinite lower bound.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_CON_RA**
 Number of constraints with finite lower and upper bounds.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_CON_EQ**
 Number of equality constraints.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_CON_FR**
 Number of unbounded constraints.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR**
 Number of variables in the problem.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_LO**
 Number of variables with a lower bound and an infinite upper bound.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_UP**
 Number of variables with an upper bound and an infinite lower bound. This value is set by
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_RA**
 Number of variables with finite lower and upper bounds.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_EQ**
 Number of fixed variables.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_FR**
 Number of free variables.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_CONT**
 Number of continuous variables.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_BIN**
 Number of binary (0-1) variables.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_ANA_PRO_NUM_VAR_INT**
 Number of general integer variables.
 This value is set by *task.analyzeproblem*.
- MSK_IINF_OPTIMIZE_RESPONSE**
 The response code returned by optimize.
- MSK_IINF_INTPNT_ITER**
 Number of interior-point iterations since invoking the interior-point optimizer.

MSK_IINF_INTPNT_FACTOR_DIM_DENSE
Dimension of the dense sub system in factorization.

MSK_IINF_INTPNT_SOLVE_DUAL
Non-zero if the interior-point optimizer is solving the dual problem.

MSK_IINF_MIO_NODE_DEPTH
Depth of the last node solved.

MSK_IINF_MIO_NUMCON
Number of constraints in the problem solved by the mixed-integer optimizer.

MSK_IINF_MIO_NUMVAR
Number of variables in the problem solved by the mixed-integer optimizer.

MSK_IINF_MIO_NUMINT
Number of integer variables in the problem solved by the mixed-integer optimizer.

MSK_IINF_MIO_PRESOLVED_NUMCONT
Number of continuous variables in the problem solved by the mixed-integer optimizer.

MSK_IINF_MIO_PRESOLVED_NUMBIN
Number of binary variables in the problem solved by the mixed-integer optimizer.

MSK_IINF_MIO_PRESOLVED_NUMCON
Number of constraints in the presolved problem.

MSK_IINF_MIO_PRESOLVED_NUMVAR
Number of variables in the presolved problem.

MSK_IINF_MIO_PRESOLVED_NUMINT
Number of integer variables in the presolved problem.

MSK_IINF_MIO_CLIQUE_TABLE_SIZE
Size of the clique table.

MSK_IINF_MIO_CONSTRUCT_SOLUTION
If this item has the value 0, then **MOSEK** did not try to construct an initial integer feasible solution. If the item has a positive value, then **MOSEK** successfully constructed an initial integer feasible solution.

MSK_IINF_MIO_CONSTRUCT_NUM_ROUNDINGS
Number of values in the integer solution that is rounded to an integer value.

MSK_IINF_MIO_NUM_INT_SOLUTIONS
Number of integer feasible solutions that has been found.

MSK_IINF_MIO_OBJ_BOUND_DEFINED
Non-zero if a valid objective bound has been found, otherwise zero.

MSK_IINF_MIO_NUM_ACTIVE_NODES
Number of active branch bound nodes.

MSK_IINF_MIO_NUM_RELAX
Number of relaxations solved during the optimization.

MSK_IINF_MIO_NUM_BRANCH
Number of branches performed during the optimization.

MSK_IINF_MIO_TOTAL_NUM_CUTS
Total number of cuts generated by the mixed-integer optimizer.

MSK_IINF_MIO_NUM_CMIR_CUTS
Number of Complemented Mixed Integer Rounding (CMIR) cuts.

MSK_IINF_MIO_NUM_CLIQUE_CUTS
Number of clique cuts.

MSK_IINF_MIO_NUM_IMPLIED_BOUND_CUTS	Number of implied bound cuts.
MSK_IINF_MIO_NUM_KNAPSACK_COVER_CUTS	Number of clique cuts.
MSK_IINF_MIO_NUM_GOMORY_CUTS	Number of Gomory cuts.
MSK_IINF_MIO_NUM_REPEATED_PRESOLVE	Number of times presolve was repeated at root.
MSK_IINF_MIO_INITIAL_SOLUTION	Is non-zero if an initial integer solution is specified.
MSK_IINF_MIO_USER_OBJ_CUT	If it is non-zero, then the objective cut is used.
MSK_IINF_MIO_RELGAP_SATISFIED	Non-zero if relative gap is within tolerances.
MSK_IINF_MIO_ABSGAP_SATISFIED	Non-zero if absolute gap is within tolerances.
MSK_IINF_MIO_NEAR_RELGAP_SATISFIED	Non-zero if relative gap is within relaxed tolerances.
MSK_IINF_MIO_NEAR_ABSGAP_SATISFIED	Non-zero if absolute gap is within relaxed tolerances.
MSK_IINF_RD_PROTOTYPE	Problem type.
MSK_IINF_RD_NUMCON	Number of constraints read.
MSK_IINF_RD_NUMVAR	Number of variables read.
MSK_IINF_RD_NUMBARVAR	Number of variables read.
MSK_IINF_RD_NUMINTVAR	Number of integer-constrained variables read.
MSK_IINF_RD_NUMQ	Number of nonempty Q matrices read.
MSK_IINF_SIM_DUAL_DEG_ITER	The number of dual degenerate iterations.
MSK_IINF_SIM_DUAL_INF_ITER	The number of iterations taken with dual infeasibility.
MSK_IINF_SIM_DUAL_HOTSTART_LU	If 1 then a valid basis factorization of full rank was located and used by the dual simplex algorithm.
MSK_IINF_SIM_PRIMAL_ITER	Number of primal simplex iterations during the last optimization.
MSK_IINF_SIM_DUAL_ITER	Number of dual simplex iterations during the last optimization.
MSK_IINF_SIM_PRIMAL_DUAL_ITER	Number of primal dual simplex iterations during the last optimization.
MSK_IINF_INTPNT_NUM_THREADS	Number of threads that the interior-point optimizer is using.

MSK_IINF_SIM_PRIMAL_INF_ITER

The number of iterations taken with primal infeasibility.

MSK_IINF_SIM_PRIMAL_DUAL_INF_ITER

The number of master iterations with dual infeasibility taken by the primal dual simplex algorithm.

MSK_IINF_SIM_PRIMAL_DEG_ITER

The number of primal degenerate iterations.

MSK_IINF_SIM_PRIMAL_DUAL_DEG_ITER

The number of degenerate major iterations taken by the primal dual simplex algorithm.

MSK_IINF_SIM_PRIMAL_HOTSTART

If 1 then the primal simplex algorithm is solving from an advanced basis.

MSK_IINF_SIM_PRIMAL_HOTSTART_LU

If 1 then a valid basis factorization of full rank was located and used by the primal simplex algorithm.

MSK_IINF_SIM_DUAL_HOTSTART

If 1 then the dual simplex algorithm is solving from an advanced basis.

MSK_IINF_SIM_PRIMAL_DUAL_HOTSTART

If 1 then the primal dual simplex algorithm is solving from an advanced basis.

MSK_IINF_SIM_PRIMAL_DUAL_HOTSTART_LU

If 1 then a valid basis factorization of full rank was located and used by the primal dual simplex algorithm.

MSK_IINF_SOL_ITR_PROSTA

Problem status of the interior-point solution. Updated after each optimization.

MSK_IINF_SOL_ITR_SOLSTA

Solution status of the interior-point solution. Updated after each optimization.

MSK_IINF_SOL_BAS_PROSTA

Problem status of the basic solution. Updated after each optimization.

MSK_IINF_SOL_BAS_SOLSTA

Solution status of the basic solution. Updated after each optimization.

MSK_IINF_SOL_ITG_PROSTA

Problem status of the integer solution. Updated after each optimization.

MSK_IINF_SOL_ITG_SOLSTA

Solution status of the integer solution. Updated after each optimization.

MSK_IINF_SIM_NUMCON

Number of constraints in the problem solved by the simplex optimizer.

MSK_IINF_SIM_NUMVAR

Number of variables in the problem solved by the simplex optimizer.

MSK_IINF_OPT_NUMCON

Number of constraints in the problem solved when the optimizer is called.

MSK_IINF_OPT_NUMVAR

Number of variables in the problem solved when the optimizer is called

MSK_IINF_STO_NUM_A_REALLOC

Number of times the storage for storing A has been changed. A large value may indicate that memory fragmentation may occur.

MSK_IINF_RD_NUMCONE

Number of conic constraints read.

MSK_IINF_SIM_SOLVE_DUAL

Is non-zero if dual problem is solved.

MSKinfypee

Information item types

MSK_INF_DOU_TYPE

Is a double information type.

MSK_INF_INT_TYPE

Is an integer.

MSK_INF_LINT_TYPE

Is a long integer.

MSKiomodee

Input/output modes

MSK_IOMODE_READ

The file is read-only.

MSK_IOMODE_WRITE

The file is write-only. If the file exists then it is truncated when it is opened. Otherwise it is created when it is opened.

MSK_IOMODE_READWRITE

The file is to read and written.

MSKbranchdire

Specifies the branching direction.

MSK_BRANCH_DIR_FREE

The mixed-integer optimizer decides which branch to choose.

MSK_BRANCH_DIR_UP

The mixed-integer optimizer always chooses the up branch first.

MSK_BRANCH_DIR_DOWN

The mixed-integer optimizer always chooses the down branch first.

MSK_BRANCH_DIR_NEAR

Branch in direction nearest to selected fractional variable.

MSK_BRANCH_DIR_FAR

Branch in direction farthest from selected fractional variable.

MSK_BRANCH_DIR_ROOT_LP

Chose direction based on root lp value of selected variable.

MSK_BRANCH_DIR_GUIDED

Branch in direction of current incumbent.

MSK_BRANCH_DIR_PSEUDOCOST

Branch based on the pseudocost of the variable.

MSKmiocontsoltypee

Continuous mixed-integer solution type

MSK_MIO_CONT_SOL_NONE

No interior-point or basic solution are reported when the mixed-integer optimizer is used.

MSK_MIO_CONT_SOL_ROOT

The reported interior-point and basic solutions are a solution to the root node problem when mixed-integer optimizer is used.

MSK_MIO_CONT_SOL_ITG

The reported interior-point and basic solutions are a solution to the problem with all integer variables fixed at the value they have in the integer solution. A solution is only reported in case the problem has a primal feasible solution.

MSK_MIO_CONT_SOL_ITG_REL

In case the problem is primal feasible then the reported interior-point and basic solutions are a solution to the problem with all integer variables fixed at the value they have in the integer solution. If the problem is primal infeasible, then the solution to the root node problem is reported.

MSKmiomodee

Integer restrictions

MSK_MIO_MODE_IGNORED

The integer constraints are ignored and the problem is solved as a continuous problem.

MSK_MIO_MODE_SATISFIED

Integer restrictions should be satisfied.

MSKmionodeseltypee

Mixed-integer node selection types

MSK_MIO_NODE_SELECTION_FREE

The optimizer decides the node selection strategy.

MSK_MIO_NODE_SELECTION_FIRST

The optimizer employs a depth first node selection strategy.

MSK_MIO_NODE_SELECTION_BEST

The optimizer employs a best bound node selection strategy.

MSK_MIO_NODE_SELECTION_WORST

The optimizer employs a worst bound node selection strategy.

MSK_MIO_NODE_SELECTION_HYBRID

The optimizer employs a hybrid strategy.

MSK_MIO_NODE_SELECTION_PSEUDO

The optimizer employs selects the node based on a pseudo cost estimate.

MSKmpsformate

MPS file format type

MSK_MPS_FORMAT_STRICT

It is assumed that the input file satisfies the MPS format strictly.

MSK_MPS_FORMAT_RELAXED

It is assumed that the input file satisfies a slightly relaxed version of the MPS format.

MSK_MPS_FORMAT_FREE

It is assumed that the input file satisfies the free MPS format. This implies that spaces are not allowed in names. Otherwise the format is free.

MSK_MPS_FORMAT_CPLEX

The CPLEX compatible version of the MPS format is employed.

MSKmsgkeye

Message keys

MSK_MSG_READING_FILE**MSK_MSG_WRITING_FILE****MSK_MSG_MPS_SELECTED****MSKobjsensee**

Objective sense types

MSK_OBJECTIVE_SENSE_MINIMIZE

The problem should be minimized.

MSK_OBJECTIVE_SENSE_MAXIMIZE

The problem should be maximized.

MSKonoffkeye

On/off

MSK_ON

Switch the option on.

MSK_OFF

Switch the option off.

MSKoptimizertypee

Optimizer types

MSK_OPTIMIZER_FREE

The optimizer is chosen automatically.

MSK_OPTIMIZER_INTPNT

The interior-point optimizer is used.

MSK_OPTIMIZER_CONIC

The optimizer for problems having conic constraints.

MSK_OPTIMIZER_PRIMAL_SIMPLEX

The primal simplex optimizer is used.

MSK_OPTIMIZER_DUAL_SIMPLEX

The dual simplex optimizer is used.

MSK_OPTIMIZER_FREE_SIMPLEX

One of the simplex optimizers is used.

MSK_OPTIMIZER_MIXED_INT

The mixed-integer optimizer.

MSKorderingtypee

Ordering strategies

MSK_ORDER_METHOD_FREE

The ordering method is chosen automatically.

MSK_ORDER_METHOD_APPMINLOC

Approximate minimum local fill-in ordering is employed.

MSK_ORDER_METHOD_EXPERIMENTAL

This option should not be used.

MSK_ORDER_METHOD_TRY_GRAPHPAR

Always try the graph partitioning based ordering.

MSK_ORDER_METHOD_FORCE_GRAPHPAR

Always use the graph partitioning based ordering even if it is worse than the approximate minimum local fill ordering.

MSK_ORDER_METHOD_NONE

No ordering is used.

MSKpresolvemodee

Presolve method.

MSK_PRESOLVE_MODE_OFF

The problem is not presolved before it is optimized.

MSK_PRESOLVE_MODE_ON

The problem is presolved before it is optimized.

MSK_PRESOLVE_MODE_FREE

It is decided automatically whether to presolve before the problem is optimized.

MSKparametertypee

Parameter type

MSK_PAR_INVALID_TYPE
Not a valid parameter.

MSK_PAR_DOU_TYPE
Is a double parameter.

MSK_PAR_INT_TYPE
Is an integer parameter.

MSK_PAR_STR_TYPE
Is a string parameter.

MSKproblemiteme
Problem data items

MSK_PI_VAR
Item is a variable.

MSK_PI_CON
Item is a constraint.

MSK_PI_CONE
Item is a cone.

MSKproblemtypes
Problem types

MSK_PROBTYPE_LO
The problem is a linear optimization problem.

MSK_PROBTYPE_QO
The problem is a quadratic optimization problem.

MSK_PROBTYPE_QCQO
The problem is a quadratically constrained optimization problem.

MSK_PROBTYPE_GECO
General convex optimization.

MSK_PROBTYPE_CONIC
A conic optimization.

MSK_PROBTYPE_MIXED
General nonlinear constraints and conic constraints. This combination can not be solved by **MOSEK**.

MSKprostae
Problem status keys

MSK_PRO_STA_UNKNOWN
Unknown problem status.

MSK_PRO_STA_PRIM_AND_DUAL_FEAS
The problem is primal and dual feasible.

MSK_PRO_STA_PRIM_FEAS
The problem is primal feasible.

MSK_PRO_STA_DUAL_FEAS
The problem is dual feasible.

MSK_PRO_STA_NEAR_PRIM_AND_DUAL_FEAS
The problem is at least nearly primal and dual feasible.

MSK_PRO_STA_NEAR_PRIM_FEAS
The problem is at least nearly primal feasible.

MSK_PRO_STA_NEAR_DUAL_FEAS
The problem is at least nearly dual feasible.

MSK_PRO_STA_PRIM_INFEAS

The problem is primal infeasible.

MSK_PRO_STA_DUAL_INFEAS

The problem is dual infeasible.

MSK_PRO_STA_PRIM_AND_DUAL_INFEAS

The problem is primal and dual infeasible.

MSK_PRO_STA_ILL_POSED

The problem is ill-posed. For example, it may be primal and dual feasible but have a positive duality gap.

MSK_PRO_STA_PRIM_INFEAS_OR_UNBOUNDED

The problem is either primal infeasible or unbounded. This may occur for mixed-integer problems.

MSKxmlwriteroutputtypee

XML writer output mode

MSK_WRITE_XML_MODE_ROW

Write in row order.

MSK_WRITE_XML_MODE_COL

Write in column order.

MSKrescodetypee

Response code type

MSK_RESPONSE_OK

The response code is OK.

MSK_RESPONSE_WRN

The response code is a warning.

MSK_RESPONSE_TRM

The response code is an optimizer termination status.

MSK_RESPONSE_ERR

The response code is an error.

MSK_RESPONSE_UNK

The response code does not belong to any class.

MSKscalingtypee

Scaling type

MSK_SCALING_FREE

The optimizer chooses the scaling heuristic.

MSK_SCALING_NONE

No scaling is performed.

MSK_SCALING_MODERATE

A conservative scaling is performed.

MSK_SCALING_AGGRESSIVE

A very aggressive scaling is performed.

MSKscalingmethode

Scaling method

MSK_SCALING_METHOD_POW2

Scales only with power of 2 leaving the mantissa untouched.

MSK_SCALING_METHOD_FREE

The optimizer chooses the scaling heuristic.

MSKsensitivitytypee

Sensitivity types

MSK_SENSITIVITY_TYPE_BASIS

Basis sensitivity analysis is performed.

MSK_SENSITIVITY_TYPE_OPTIMAL_PARTITION

Optimal partition sensitivity analysis is performed.

MSKsimseltypee

Simplex selection strategy

MSK_SIM_SELECTION_FREE

The optimizer chooses the pricing strategy.

MSK_SIM_SELECTION_FULL

The optimizer uses full pricing.

MSK_SIM_SELECTION_ASE

The optimizer uses approximate steepest-edge pricing.

MSK_SIM_SELECTION_DEVEX

The optimizer uses devex steepest-edge pricing (or if it is not available an approximate steep-edge selection).

MSK_SIM_SELECTION_SE

The optimizer uses steepest-edge selection (or if it is not available an approximate steep-edge selection).

MSK_SIM_SELECTION_PARTIAL

The optimizer uses a partial selection approach. The approach is usually beneficial if the number of variables is much larger than the number of constraints.

MSKsoliteme

Solution items

MSK_SOL_ITEM_XC

Solution for the constraints.

MSK_SOL_ITEM_XX

Variable solution.

MSK_SOL_ITEM_Y

Lagrange multipliers for equations.

MSK_SOL_ITEM_SLC

Lagrange multipliers for lower bounds on the constraints.

MSK_SOL_ITEM_SUC

Lagrange multipliers for upper bounds on the constraints.

MSK_SOL_ITEM_SLX

Lagrange multipliers for lower bounds on the variables.

MSK_SOL_ITEM_SUX

Lagrange multipliers for upper bounds on the variables.

MSK_SOL_ITEM_SNX

Lagrange multipliers corresponding to the conic constraints on the variables.

MSKsolstae

Solution status keys

MSK_SOL_STA_UNKNOWN

Status of the solution is unknown.

MSK_SOL_STA_OPTIMAL

The solution is optimal.

MSK_SOL_STA_PRIM_FEAS

The solution is primal feasible.

MSK_SOL_STA_DUAL_FEAS

The solution is dual feasible.

MSK_SOL_STA_PRIM_AND_DUAL_FEAS

The solution is both primal and dual feasible.

MSK_SOL_STA_NEAR_OPTIMAL

The solution is nearly optimal.

MSK_SOL_STA_NEAR_PRIM_FEAS

The solution is nearly primal feasible.

MSK_SOL_STA_NEAR_DUAL_FEAS

The solution is nearly dual feasible.

MSK_SOL_STA_NEAR_PRIM_AND_DUAL_FEAS

The solution is nearly both primal and dual feasible.

MSK_SOL_STA_PRIM_INFEAS_CER

The solution is a certificate of primal infeasibility.

MSK_SOL_STA_DUAL_INFEAS_CER

The solution is a certificate of dual infeasibility.

MSK_SOL_STA_NEAR_PRIM_INFEAS_CER

The solution is almost a certificate of primal infeasibility.

MSK_SOL_STA_NEAR_DUAL_INFEAS_CER

The solution is almost a certificate of dual infeasibility.

MSK_SOL_STA_PRIM_ILLPOSED_CER

The solution is a certificate that the primal problem is illposed.

MSK_SOL_STA_DUAL_ILLPOSED_CER

The solution is a certificate that the dual problem is illposed.

MSK_SOL_STA_INTEGER_OPTIMAL

The primal solution is integer optimal.

MSK_SOL_STA_NEAR_INTEGER_OPTIMAL

The primal solution is near integer optimal.

MSKsoltypee

Solution types

MSK_SOL_BAS

The basic solution.

MSK_SOL_ITR

The interior solution.

MSK_SOL_ITG

The integer solution.

MSKsolveforme

Solve primal or dual form

MSK_SOLVE_FREE

The optimizer is free to solve either the primal or the dual problem.

MSK_SOLVE_PRIMAL

The optimizer should solve the primal problem.

MSK_SOLVE_DUAL

The optimizer should solve the dual problem.

MSKstakeye

Status keys

MSK_SK_UNK

The status for the constraint or variable is unknown.

MSK_SK_BAS

The constraint or variable is in the basis.

MSK_SK_SUPBAS

The constraint or variable is super basic.

MSK_SK_LOW

The constraint or variable is at its lower bound.

MSK_SK_UPR

The constraint or variable is at its upper bound.

MSK_SK_FIX

The constraint or variable is fixed.

MSK_SK_INF

The constraint or variable is infeasible in the bounds.

MSKstartpointtypee

Starting point types

MSK_STARTING_POINT_FREE

The starting point is chosen automatically.

MSK_STARTING_POINT_GUESS

The optimizer guesses a starting point.

MSK_STARTING_POINT_CONSTANT

The optimizer constructs a starting point by assigning a constant value to all primal and dual variables. This starting point is normally robust.

MSK_STARTING_POINT_SATISFY_BOUNDS

The starting point is chosen to satisfy all the simple bounds on nonlinear variables. If this starting point is employed, then more care than usual should be employed when choosing the bounds on the nonlinear variables. In particular very tight bounds should be avoided.

MSKstreamtypee

Stream types

MSK_STREAM_LOG

Log stream. Contains the aggregated contents of all other streams. This means that a message written to any other stream will also be written to this stream.

MSK_STREAM_MSG

Message stream. Log information relating to performance and progress of the optimization is written to this stream.

MSK_STREAM_ERR

Error stream. Error messages are written to this stream.

MSK_STREAM_WRN

Warning stream. Warning messages are written to this stream.

MSKvaluee

Integer values

MSK_MAX_STR_LENMaximum string length allowed in **MOSEK**.**MSK_LICENSE_BUFFER_LENGTH**

The length of a license key buffer.

MSKvariabletypee

Variable types

MSK_VAR_TYPE_CONT

Is a continuous variable.

MSK_VAR_TYPE_INT

Is an integer variable.

16.7 Data Types

MSKenv_t

The **MOSEK** Environment type.

MSKtask_t

The **MOSEK** Task type.

MSKuserhandle_t

A pointer to a generic user-defined structure.

MSKboolean_t

A signed integer interpreted as a boolean value.

MSKint32t

Signed 32bit integer.

MSKint64t

Signed 64bit integer.

MSKwchar_t

Wide char type. The actual type may differ depending on the platform; it is either a 16 or 32 bits signed or unsigned integer.

MSKrealt

The floating point type used by **MOSEK**.

MSKstring_t

The string type used by **MOSEK**. This is an UTF-8 encoded zero-terminated char string.

MSKiparam

int parameter type. See *Integer Parameters*

MSKdparam

double parameter type. See *Double Parameters*

MSKsparam

string parameter type. See *String Parameters*

MSKrescodee

The return code type.

16.8 Functions Type

MSK_callbackfunc(task, usrptr, caller, douinf, intinf, lintinf)

The progress call-back function is a user-defined function which will be called by **MOSEK** occasionally during the optimization process. In particular, the call-back function is called at the beginning of each iteration in the interior-point optimizer. For the simplex optimizers *MSK_IPAR_LOG_SIM_FREQ* controls how frequently the call-back is called.

The call-back provides an integer denoting the point in the solver from which the call happened, and a set of arrays containing information items related to the current state of the solver.

Typically the user-defined call-back function displays information about the solution process. The call-back function can also be used to terminate the optimization process since if the progress call-back function returns a non-zero value, the optimization process is aborted.

The user *must not* call any **MOSEK** function directly or indirectly from the call-back function.

Parameters

- [in] `task` (*MSKtask_t*) – An optimization task.
- [io] `usrptr` (*MSKuserhandle_t*) – A pointer to a user-defined structure.
- [in] `caller` (*MSKcallbackcodee*) – An integer which tells where the function was called from. See section *MSKcallbackcodee* for the possible values of this argument.
- [in] `douinf` (*MSKrealt*) – An array of doubles. The elements correspond to the definitions in *MSKdinfiteme*.
- [in] `intinf` (*MSKint32t*) – An array of doubles. The elements correspond to the definitions in *MSKiinfiteme*.
- [in] `lintinf` (*MSKint64t*) – An array of double. The elements correspond to the definitions in *MSKiinfiteme*.

Return

- `void` (*MSKint32t*) – If the return value is non-zero, **MOSEK** terminates whatever it is doing and returns control to the calling application.

MSK_exitfunc(usrptr, file, line, msg)

A user-defined exit function which is called in case of fatal errors to handle an error message and terminate the program. The function should never return.

Parameters

- [io] `usrptr` (*MSKuserhandle_t*) – A pointer to a user-defined structure.
- [in] `file` (*MSKstring_t*) – The name of the file where the fatal error occurred.
- [in] `line` (*MSKint32t*) – The line number in the file where the fatal error occurred.
- [in] `msg` (*MSKstring_t*) – A message about the error.

MSK_freefunc(usrptr, buffer)

A user-defined memory freeing function.

Parameters

- [in] `usrptr` (*MSKuserhandle_t*) – A pointer to a user-defined structure.
- [io] `buffer` (`void*`) – A pointer to the buffer which should be freed.

MSK_mallocfunc(usrptr, size)

A user-defined memory allocation function.

Parameters

- [in] `usrptr` (*MSKuserhandle_t*) – A pointer to a user-defined structure.
- [in] `size` (`size_t`) – The number of characters to allocate.

MSK_callocfunc(usrptr, num, size)

A user-defined memory allocation function. The function must be compatible with the C `calloc` function.

Parameters

- [in] `usrptr` (*MSKuserhandle_t*) – A pointer to a user-defined structure.
- [in] `num` (`size_t`) – The number of elements.
- [in] `size` (`size_t`) – The number of elements.

MSK_reallocfunc(usrptr, ptr, size)

A user-defined memory allocation function. The function must be compatible with the C `realloc` function.

Parameters

- [in] `usrptr` (*MSKuserhandle_t*) – A pointer to a user-defined structure.
- [io] `ptr` (*void**) – The pointer to reallocated.
- [in] `size` (*size_t*) – Size of the new block.

`MSK_nlggetspfunc`(*nlhandle*, *numgrdobjnz*, *grdobjsub*, *i*, *convali*, *grdconinz*, *grdconisub*, *yo*, *numycnz*, *ybsub*, *maxnumhesnz*, *numhesnz*, *hessubi*, *hessubj*)

Type definition of the call-back function which is used to provide structural information about the nonlinear functions f and g in the optimization problem.

Hence, it is the user's responsibility to provide a function satisfying the definition.

The user *must not* call any **MOSEK** function directly or indirectly from the call-back function.

Parameters

- [io] `nlhandle` (*MSKuserhandle_t*) – A pointer to a user-defined data structure specified when the function is attached to a task using the function *task.putnlfunc*.
- [out] `numgrdobjnz` (*MSKint32t*) – If requested, `numgrdobjnz` should be assigned the number of non-zero elements in the gradient of f .
- [out] `grdobjsub` (*MSKint32t*) – If requested then it contains the positions of the non-zero elements in the gradient of f . The elements are stored in

$$\text{grdobjsub}[0, \dots, \text{numgrdobjnz} - 1].$$

- [in] `i` (*MSKint32t*) – Index of a constraint. If $i < 0$ or $i \geq \text{numcon}$, no information about a constraint is requested.
- [out] `convali` (*MSKboolean_t*) – If requested, assign a true/false value indicating if constraint i contains general nonlinear terms.
- [out] `grdconinz` (*MSKint32t*) – If requested, assign a true/false value indicating if constraint i contains general nonlinear terms.
- [out] `grdconisub` (*MSKint32t*) – If requested, this array shall contain the indexes of the non-zeros in $\nabla g_i(x)$. The length of the array must be the same as given in `grdconinz`.
- [in] `yo` (*MSKint32t*) – If non-zero, then the f shall be included when the gradient and the Hessian of the Lagrangian are computed.
- [in] `numycnz` (*MSKint32t*) – Number of constraint functions which are included in the definition of the Lagrangian. See (16.5).
- [in] `ybsub` (*MSKint32t*) – Index of constraint functions which are included in the definition of the Lagrangian. See (16.5).
- [in] `maxnumhesnz` (*MSKint32t*) – Length of the arguments `hessubi` and `hessubj`.
- [out] `numhesnz` (*MSKint32t*) – If requested, `numhesnz` should be assigned the number of non-zero elements in the lower triangular part of the Hessian of the Lagrangian:

$$L := yof(x) - \sum_{k=0}^{\text{numycnz}-1} g_{\text{ybsub}[k]}(x). \quad (16.5)$$

- [out] `hessubi` (*MSKint32t*) – If requested, `hessubi` and `hessubj` are used to convey the position of the non-zeros in the Hessian of the Lagrangian L (see (16.5)) as follows

$$\nabla^2 L_{\text{hessubi}[k], \text{hessubj}[k]}(x) \neq 0.0$$

for $k = 0, \dots, \text{numhesnz} - 1$.

All other positions in L are assumed to be zero. Please note that *only* the lower or the upper triangular part of the Hessian should be return.

- [out] `hessubj` (*MSKint32t*) – See the argument *hessubi*.

Return

- `void` (*MSKint32t*) – If the return is non-zero, **MOSEK** assumes that an error during the structure computation, and optimization will be terminated.

`MSK_nlgetvafunc`(`nlhandle`, `xx`, `yo`, `yc`, `objval`, `numgrdobjnz`, `grdobjsub`, `grdobjval`, `numi`,
`subi`, `conval`, `grdconptrb`, `grdconptre`, `grdconsub`, `grdconval`, `grdlag`,
`maxnumhesnz`, `numhesnz`, `hessubi`, `hessubj`, `hesval`)

Type definition of the call-back function which is used to provide structural and numerical information about the nonlinear functions f and g in an optimization problem.

For later use we need the definition of the Lagrangian L which is given by

$$L := y_o * f(\mathbf{xx}) - \sum_{k=0}^{numi-1} y_{c_{subi[k]}} g_{subi[k]}(\mathbf{xx}). \quad (16.6)$$

The user *must not* call any **MOSEK** function directly or indirectly from the call-back function.

Parameters

- [io] `nlhandle` (*MSKuserhandle_t*) – A pointer to a user-defined data structure. The pointer is passed to **MOSEK** when the function *task.putnlfunc* is called.
- [in] `xx` (*MSKreal_t*) – The point at which the nonlinear function must be evaluated. The length equals the number of variables in the task.
- [in] `yo` (*MSKreal_t*) – Multiplier on the objective function f .
- [in] `yc` (*MSKreal_t*) – Multipliers for the constraint functions g_i . The length is `numcon`.
- [out] `objval` (*MSKreal_t*) – If requested, `objval` shall be assigned the value of f evaluated at \mathbf{xx} .
- [out] `numgrdobjnz` (*MSKint32t*) – If requested, `numgrdobjnz` shall be assigned the number of non-zero elements in the gradient of f .
- [out] `grdobjsub` (*MSKint32t*) – If requested, it shall contain the position of the non-zero elements in the gradient of f . The elements are stored in

$$\text{grdobjsub}[0, \dots, \text{numgrdobjnz} - 1].$$

- [out] `grdobjval` (*MSKreal_t*) – If requested, it shall contain the gradient of f evaluated at \mathbf{xx} . The following data structure

$$\text{grdobjval}[k] = \frac{\partial f}{\partial x_{\text{grdobjsub}[k]}}(\mathbf{xx})$$

for $k = 0, \dots, \text{numgrdobjnz} - 1$ is used.

- [in] `numi` (*MSKint32t*) – Number of elements in `subi`.
- [in] `subi` (*MSKint32t*) – `subi[0, ..., numi - 1]` contain the indexes of the constraints that has to be evaluated. The length is `numi`.
- [out] `conval` (*MSKreal_t*) – $g(\mathbf{xx})$ for the required constraint functions i.e.

$$\text{conval}[k] = g_{subi[k]}(\mathbf{xx})$$

for $k = 0, \dots, \text{numi} - 1$.

- [in] `grdconptrb` (*MSKint32t*) – If given, it specifies the structure of the gradients of the constraint functions. See the argument `grdconval` for details.
- [in] `grdconptre` (*MSKint32t*) – If given, it specifies the structure of the gradients of the constraint functions. See the argument `grdconval` for details.

- [in] `grdconsub` (*MSKint32t*) – It shall specifies the positions of the non-zeros in the gradients of the constraints. See the argument `grdconval` for details.
- [out] `grdconval` (*MSKrealt*) – If requested, it shall specify the values of the gradient of the nonlinear constraints.

Together `grdconptrb`, `grdconptre`, `grdconsub` and `grdconval` are used to specify the gradients of the nonlinear constraint functions.

The gradient data is stored as follows

$$\text{grdconval}[k] = \frac{\partial g_{\text{subi}[i]}(xx)}{\partial xx_{\text{grdconsub}[k]}}, \quad \text{for} \\ k = \text{grdconptrb}[i], \dots, \text{grdconptre}[i] - 1, \\ i = 0, \dots, \text{numi} - 1.$$

- [out] `grdlag` (*MSKrealt*) – If requested, `grdlag` shall contain the gradient of the Lagrangian function, i.e.

$$\text{grdlag} = \nabla L.$$

- [in] `maxnumhesnz` (*MSKint32t*) – Maximum number of non-zeros in the Hessian of the Lagrangian, i.e. `maxnumhesnz` is the length of the arrays `hessubi`, `hessubj`, and `hesval`.
- [out] `numhesnz` (*MSKint32t*) – If requested, `numhesnz` shall be assigned the number of non-zeros elements in the Hessian of the Lagrangian L . See (16.6).
- [out] `hessubi` (*MSKint32t*) – See the argument `hesval`.
- [out] `hessubj` (*MSKint32t*) – See the argument `hesval`.
- [out] `hesval` (*MSKrealt*) – Together `hessubi`, `hessubj`, and `hesval` specify the Hessian of the Lagrangian function L defined in (16.6).

The Hessian is stored in the following format:

$$\text{hesval}[k] = \nabla^2 L_{\min(\text{hessubi}[k], \text{hessubj}[k]), \max(\text{hessubi}[k], \text{hessubj}[k])}$$

for $k = 0, \dots, \text{numhesnz}[0] - 1$. Please note that if an element is specified multiple times, then the elements are added together. Hence, *only* the lower *or* the upper triangular part of the Hessian should be returned.

Return

- void (*MSKint32t*) – If the return value is non-zero, **MOSEK** will assume an error happened during the function evaluation.

MSK_streamfunc(handle, str)

A function of this type can be linked to any of the **MOSEK** streams. This implies that if a message is send to the stream to which the function is linked, the function is called by **MOSEK** and the argument `str` will contain the message. Hence, the user can decide what should happen to message.

The user *must not* call any **MOSEK** function directly or indirectly from the call-back function.

Parameters

- [io] `handle` (*MSKuserhandle_t*) – A pointer to a user-defined data structure (or a null pointer).
- [in] `str` (*MSKstring_t*) – A string containing a message to a stream.

MSK_responsefunc(handle, r, msg)

Whenever **MOSEK** generate a warning or an error this function is called. The argument `r` contains the code of the error/warning and the argument `msg` contains the corresponding error/warning message. This function should always return *MSK_RES_OK (0)*.

Parameters

- [io] `handle` (*MSKuserhandle_t*) – A pointer to a user-defined data structure (or a null pointer).
- [in] `r` (*MSKrescodee*) – The response code corresponding to the exception.
- [in] `msg` (*MSKstring_t*) – A string containing the exception message.

Return

- void (*MSKrescodee*)

SUPPORTED FILE FORMATS

MOSEK supports a range of problem and solution formats listed in [Table 17.1](#) and [Table 17.2](#). The **Task format** is **MOSEK**'s native binary format and it supports all features that **MOSEK** supports. The **OPF format** is **MOSEK**'s human-readable alternative that supports nearly all features (everything except semidefinite problems). In general, text formats are significantly slower to read, but can be examined and edited directly in any text editor.

Problem formats

See [Table 17.1](#).

Table 17.1: List of supported file formats for optimization problems.

Format Type	Ext.	Binary/Text	LP	QP	CQO	SDP
<i>LP</i>	lp	plain text	X	X		
<i>MPS</i>	mps	plain text	X	X		
<i>OPF</i>	opf	plain text	X	X	X	
<i>CBF</i>	cbf	plain text	X		X	X
<i>Osil</i>	xml	xml text	X	X		
<i>Task format</i>	task	binary	X	X	X	X
<i>Jtask format</i>	jtask	text	X	X	X	X

Solution formats

See [Table 17.2](#).

Table 17.2: List of supported solution formats.

Format Type	Ext.	Binary/Text	Description
<i>SOL</i>	sol	plain text	Interior Solution
	bas	plain text	Basic Solution
	int	plain text	Integer
<i>Jsol format</i>	jsol	text	Solution

Compression

MOSEK supports GZIP compression of files. Problem files with an additional `.gz` extension are assumed to be compressed when read, and are automatically compressed when written. For example, a file called

problem.mps.gz

will be considered as a GZIP compressed MPS file.

17.1 The LP File Format

MOSEK supports the LP file format with some extensions. The LP format is not a completely well-defined standard and hence different optimization packages may interpret the same LP file in slightly different ways. **MOSEK** tries to emulate as closely as possible CPLEX's behavior, but tries to stay backward compatible.

The LP file format can specify problems on the form

$$\begin{array}{ll} \text{minimize/maximize} & c^T x + \frac{1}{2} q^o(x) \\ \text{subject to} & \begin{array}{lll} l^c \leq & Ax + \frac{1}{2} q(x) & \leq u^c, \\ l^x \leq & x & \leq u^x, \\ & x_{\mathcal{J}} \text{ integer,} \end{array} \end{array}$$

where

- $x \in \mathbb{R}^n$ is the vector of decision variables.
- $c \in \mathbb{R}^n$ is the linear term in the objective.
- $q^o : \mathbb{R}^n \rightarrow \mathbb{R}$ is the quadratic term in the objective where

$$q^o(x) = x^T Q^o x$$

and it is assumed that

$$Q^o = (Q^o)^T.$$

- $A \in \mathbb{R}^{m \times n}$ is the constraint matrix.
- $l^c \in \mathbb{R}^m$ is the lower limit on the activity for the constraints.
- $u^c \in \mathbb{R}^m$ is the upper limit on the activity for the constraints.
- $l^x \in \mathbb{R}^n$ is the lower limit on the activity for the variables.
- $u^x \in \mathbb{R}^n$ is the upper limit on the activity for the variables.
- $q : \mathbb{R}^n \rightarrow \mathbb{R}$ is a vector of quadratic functions. Hence,

$$q_i(x) = x^T Q^i x$$

where it is assumed that

$$Q^i = (Q^i)^T.$$

- $\mathcal{J} \subseteq \{1, 2, \dots, n\}$ is an index set of the integer constrained variables.

17.1.1 File Sections

An LP formatted file contains a number of sections specifying the objective, constraints, variable bounds, and variable types. The section keywords may be any mix of upper and lower case letters.

Objective Function

The first section beginning with one of the keywords

```

max
maximum
maximize
min
minimum
minimize

```

defines the objective sense and the objective function, i.e.

$$c^T x + \frac{1}{2} x^T Q^o x.$$

The objective may be given a name by writing

```
myname:
```

before the expressions. If no name is given, then the objective is named `obj`.

The objective function contains linear and quadratic terms. The linear terms are written as:

```
4 x1 + x2 - 0.1 x3
```

and so forth. The quadratic terms are written in square brackets (`[]`) and are either squared or multiplied as in the examples

```
x1^2
```

and

```
x1 * x2
```

There may be zero or more pairs of brackets containing quadratic expressions.

An example of an objective section is

```

minimize
myobj: 4 x1 + x2 - 0.1 x3 + [ x1^2 + 2.1 x1 * x2 ]/2

```

Please note that the quadratic expressions are multiplied with $\frac{1}{2}$, so that the above expression means

$$\text{minimize } 4x_1 + x_2 - 0.1 \cdot x_3 + \frac{1}{2}(x_1^2 + 2.1 \cdot x_1 \cdot x_2)$$

If the same variable occurs more than once in the linear part, the coefficients are added, so that `4 x1 + 2 x1` is equivalent to `6 x1`. In the quadratic expressions `x1 * x2` is equivalent to `x2 * x1` and, as in the linear part, if the same variables multiplied or squared occur several times their coefficients are added.

Constraints

The second section beginning with one of the keywords

```

subj to
subject to
s.t.
st

```

defines the linear constraint matrix A and the quadratic matrices Q^i .

A constraint contains a name (optional), expressions adhering to the same rules as in the objective and a bound:

```

subject to
con1: x1 + x2 + [ x3^2 ]/2 <= 5.1

```

The bound type (here \leq) may be any of $<$, \leq , $=$, $>$, \geq ($<$ and \leq mean the same), and the bound may be any number.

In the standard LP format it is not possible to define more than one bound, but **MOSEK** supports defining ranged constraints by using double-colon ($::$) instead of a single-colon ($:$) after the constraint name, i.e.

$$-5 \leq x_1 + x_2 \leq 5 \quad (17.1)$$

may be written as

```
con:: -5 < x_1 + x_2 < 5
```

By default **MOSEK** writes ranged constraints this way.

If the files must adhere to the LP standard, ranged constraints must either be split into upper bounded and lower bounded constraints or be written as an equality with a slack variable. For example the expression (17.1) may be written as

$$x_1 + x_2 - sl_1 = 0, \quad -5 \leq sl_1 \leq 5.$$

Bounds

Bounds on the variables can be specified in the bound section beginning with one of the keywords

```
bound
bounds
```

The bounds section is optional but should, if present, follow the **subject to** section. All variables listed in the bounds section must occur in either the objective or a constraint.

The default lower and upper bounds are 0 and $+\infty$. A variable may be declared free with the keyword **free**, which means that the lower bound is $-\infty$ and the upper bound is $+\infty$. Furthermore it may be assigned a finite lower and upper bound. The bound definitions for a given variable may be written in one or two lines, and bounds can be any number or $\pm\infty$ (written as **+inf/-inf/+infinity/-infinity**) as in the example

```
bounds
x1 free
x2 <= 5
0.1 <= x2
x3 = 42
2 <= x4 < +inf
```

Variable Types

The final two sections are optional and must begin with one of the keywords

```
bin
binaries
binary
```

and

```
gen
general
```

Under **general** all integer variables are listed, and under **binary** all binary (integer variables with bounds 0 and 1) are listed:

```

general
x1 x2
binary
x3 x4

```

Again, all variables listed in the binary or general sections must occur in either the objective or a constraint.

Terminating Section

Finally, an LP formatted file must be terminated with the keyword

```
end
```

17.1.2 LP File Examples

Linear example lo1.lp

```

\ File: lo1.lp
maximize
obj: 3 x1 + x2 + 5 x3 + x4
subject to
c1: 3 x1 + x2 + 2 x3 = 30
c2: 2 x1 + x2 + 3 x3 + x4 >= 15
c3: 2 x2 + 3 x4 <= 25
bounds
0 <= x1 <= +infinity
0 <= x2 <= 10
0 <= x3 <= +infinity
0 <= x4 <= +infinity
end

```

Mixed integer example milo1.lp

```

maximize
obj: x1 + 6.4e-01 x2
subject to
c1: 5e+01 x1 + 3.1e+01 x2 <= 2.5e+02
c2: 3e+00 x1 - 2e+00 x2 >= -4e+00
bounds
0 <= x1 <= +infinity
0 <= x2 <= +infinity
general
x1 x2
end

```

17.1.3 LP Format peculiarities

Comments

Anything on a line after a \ is ignored and is treated as a comment.

Names

A name for an objective, a constraint or a variable may contain the letters *a-z*, *A-Z*, the digits *0-9* and the characters

!"#\$%&()/,.;?@_`' ~

The first character in a name must not be a number, a period or the letter *e* or *E*. Keywords must not be used as names.

MOSEK accepts any character as valid for names, except `\0`. A name that is not allowed in LP file will be changed and a warning will be issued.

The algorithm for making names LP valid works as follows: The name is interpreted as an **utf-8** string. For a unicode character *c*:

- If *c*==`_` (underscore), the output is `__` (two underscores).
- If *c* is a valid LP name character, the output is just *c*.
- If *c* is another character in the ASCII range, the output is `_XX`, where *XX* is the hexadecimal code for the character.
- If *c* is a character in the range *127-65535*, the output is `_uXXXX`, where *XXXX* is the hexadecimal code for the character.
- If *c* is a character above 65535, the output is `_UXXXXXXXX`, where *XXXXXXXX* is the hexadecimal code for the character.

Invalid **utf-8** substrings are escaped as `_XX'`, and if a name starts with a period, *e* or *E*, that character is escaped as `_XX`.

Variable Bounds

Specifying several upper or lower bounds on one variable is possible but **MOSEK** uses only the tightest bounds. If a variable is fixed (with `=`), then it is considered the tightest bound.

MOSEK Extensions to the LP Format

Some optimization software packages employ a more strict definition of the LP format than the one used by **MOSEK**. The limitations imposed by the strict LP format are the following:

- Quadratic terms in the constraints are not allowed.
- Names can be only 16 characters long.
- Lines must not exceed 255 characters in length.

If an LP formatted file created by **MOSEK** should satisfy the strict definition, then the parameter

- `MSK_IPAR_WRITE_LP_STRICT_FORMAT`

should be set; note, however, that some problems cannot be written correctly as a strict LP formatted file. For instance, all names are truncated to 16 characters and hence they may lose their uniqueness and change the problem.

To get around some of the inconveniences converting from other problem formats, **MOSEK** allows lines to contain 1024 characters and names may have any length (shorter than the 1024 characters).

Internally in **MOSEK** names may contain any (printable) character, many of which cannot be used in LP names. Setting the parameters

- `MSK_IPAR_READ_LP_QUOTED_NAMES` and
- `MSK_IPAR_WRITE_LP_QUOTED_NAMES`

allows **MOSEK** to use quoted names. The first parameter tells **MOSEK** to remove quotes from quoted names e.g, "x1", when reading LP formatted files. The second parameter tells **MOSEK** to put quotes around any semi-illegal name (names beginning with a number or a period) and fully illegal name (containing illegal characters). As double quote is a legal character in the LP format, quoting semi-illegal names makes them legal in the pure LP format as long as they are still shorter than 16 characters. Fully illegal names are still illegal in a pure LP file.

17.1.4 The strict LP format

The LP format is not a formal standard and different vendors have slightly different interpretations of the LP format. To make **MOSEK**'s definition of the LP format more compatible with the definitions of other vendors, use the parameter setting

- `MSK_IPAR_WRITE_LP_STRICT_FORMAT = MSK_ON`

This setting may lead to truncation of some names and hence to an invalid LP file. The simple solution to this problem is to use the parameter setting

- `MSK_IPAR_WRITE_GENERIC_NAMES = MSK_ON`

which will cause all names to be renamed systematically in the output file.

17.1.5 Formatting of an LP File

A few parameters control the visual formatting of LP files written by **MOSEK** in order to make it easier to read the files. These parameters are

- `MSK_IPAR_WRITE_LP_LINE_WIDTH`
- `MSK_IPAR_WRITE_LP_TERMS_PER_LINE`

The first parameter sets the maximum number of characters on a single line. The default value is 80 corresponding roughly to the width of a standard text document.

The second parameter sets the maximum number of terms per line; a term means a sign, a coefficient, and a name (for example + 42 elephants). The default value is 0, meaning that there is no maximum.

Unnamed Constraints

Reading and writing an LP file with **MOSEK** may change it superficially. If an LP file contains unnamed constraints or objective these are given their generic names when the file is read (however unnamed constraints in **MOSEK** are written without names).

17.2 The MPS File Format

MOSEK supports the standard MPS format with some extensions. For a detailed description of the MPS format see the book by Nazareth [Naz87].

17.2.1 MPS File Structure

The version of the MPS format supported by **MOSEK** allows specification of an optimization problem of the form

$$\begin{aligned} l^c &\leq Ax + q(x) &&\leq u^c, \\ l^x &\leq x &&\leq u^x, \\ &x \in \mathcal{K}, \\ &x_{\mathcal{J}} \text{ integer}, \end{aligned} \tag{17.2}$$

where

- $x \in \mathbb{R}^n$ is the vector of decision variables.
- $A \in \mathbb{R}^{m \times n}$ is the constraint matrix.
- $l^c \in \mathbb{R}^m$ is the lower limit on the activity for the constraints.
- $u^c \in \mathbb{R}^m$ is the upper limit on the activity for the constraints.
- $l^x \in \mathbb{R}^n$ is the lower limit on the activity for the variables.
- $u^x \in \mathbb{R}^n$ is the upper limit on the activity for the variables.
- $q : \mathbb{R}^n \rightarrow \mathbb{R}$ is a vector of quadratic functions. Hence,

$$q_i(x) = \frac{1}{2} x^T Q^i x$$

where it is assumed that

$$Q^i = (Q^i)^T.$$

Please note the explicit $\frac{1}{2}$ in the quadratic term and that Q^i is required to be symmetric.

- \mathcal{K} is a convex cone.
- $\mathcal{J} \subseteq \{1, 2, \dots, n\}$ is an index set of the integer-constrained variables.

An MPS file with one row and one column can be illustrated like this:

```
*          1          2          3          4          5          6
*23456789012345678901234567890123456789012345678901234567890
NAME          [name]
OBJSENSE
[objsense]
OBJNAME
[objname]
ROWS
? [cname1]
COLUMNS
[vname1] [cname1] [value1] [vname3] [value2]
RHS
[name] [cname1] [value1] [cname2] [value2]
RANGES
[name] [cname1] [value1] [cname2] [value2]
QSECTION      [cname1]
[vname1] [vname2] [value1] [vname3] [value2]
QMATRIX
[vname1] [vname2] [value1]
QUADOBJ
[vname1] [vname2] [value1]
QCMATRIX      [cname1]
[vname1] [vname2] [value1]
BOUNDS
?? [name] [vname1] [value1]
CSECTION      [kname1] [value1] [ktype]
[vname1]
ENDATA
```

Here the names in capitals are keywords of the MPS format and names in brackets are custom defined names or values. A couple of notes on the structure:

- Fields: All items surrounded by brackets appear in *fields*. The fields named “valueN” are numerical values. Hence, they must have the format

```
[+|-]XXXXXXXX.XXXXXX[[e|E][+|-]XXX]
```

where

```
.. code-block:: text
```

```
X = [0|1|2|3|4|5|6|7|8|9].
```

- Sections: The MPS file consists of several sections where the names in capitals indicate the beginning of a new section. For example, COLUMNS denotes the beginning of the columns section.
- Comments: Lines starting with an * are comment lines and are ignored by **MOSEK**.
- Keys: The question marks represent keys to be specified later.
- Extensions: The sections QSECTION and CSECTION are specific **MOSEK** extensions of the MPS format. The sections QMATRIX, QUADOBJ and QCMATRIX are included for sake of compatibility with other vendors extensions to the MPS format.

The standard MPS format is a fixed format, i.e. everything in the MPS file must be within certain fixed positions. **MOSEK** also supports a *free format*. See Section 17.2.9 for details.

Linear example lo1.mps

A concrete example of a MPS file is presented below:

```
* File: lo1.mps
NAME          lo1
OBJSENSE
    MAX
ROWS
N  obj
E  c1
G  c2
L  c3
COLUMNS
    x1      obj      3
    x1      c1       3
    x1      c2       2
    x2      obj      1
    x2      c1       1
    x2      c2       1
    x2      c3       2
    x3      obj      5
    x3      c1       2
    x3      c2       3
    x4      obj      1
    x4      c2       1
    x4      c3       3
RHS
    rhs     c1      30

    rhs     c3      25
RANGES
BOUNDS
UP bound    x2      10
ENDATA
```

Subsequently each individual section in the MPS format is discussed.

Section NAME

In this section a name ([name]) is assigned to the problem.

OBJSENSE (optional)

This is an optional section that can be used to specify the sense of the objective function. The **OBJSENSE** section contains one line at most which can be one of the following

```
MIN
MINIMIZE
MAX
MAXIMIZE
```

It should be obvious what the implication is of each of these four lines.

OBJNAME (optional)

This is an optional section that can be used to specify the name of the row that is used as objective function. The **OBJNAME** section contains one line at most which has the form

```
objname
```

`objname` should be a valid row name.

ROWS

A record in the **ROWS** section has the form

```
? [cname1]
```

where the requirements for the fields are as follows:

Field	Starting Position	Max Width	required	Description
?	2	1	Yes	Constraint key
[cname1]	5	8	Yes	Constraint name

Hence, in this section each constraint is assigned an unique name denoted by `[cname1]`. Please note that `[cname1]` starts in position 5 and the field can be at most 8 characters wide. An initial key ? must be present to specify the type of the constraint. The key can have the values E, G, L, or N with the following interpretation:

Constraint type	l_i^c	u_i^c
E	finite	l_i^c
G	finite	∞
L	$-\infty$	finite
N	$-\infty$	∞

In the MPS format an objective vector is not specified explicitly, but one of the constraints having the key N will be used as the objective vector c . In general, if multiple N type constraints are specified, then the first will be used as the objective vector c .

COLUMNS

In this section the elements of A are specified using one or more records having the form:

```
[vname1] [cname1] [value1] [cname2] [value2]
```

where the requirements for each field are as follows:

Field	Starting Position	Max Width	required	Description
[vname1]	5	8	Yes	Variable name
[cname1]	15	8	Yes	Constraint name
[value1]	25	12	Yes	Numerical value
[cname2]	40	8	No	Constraint name
[value2]	50	12	No	Numerical value

Hence, a record specifies one or two elements a_{ij} of A using the principle that [vname1] and [cname1] determines j and i respectively. Please note that [cname1] must be a constraint name specified in the ROWS section. Finally, [value1] denotes the numerical value of a_{ij} . Another optional element is specified by [cname2], and [value2] for the variable specified by [vname1]. Some important comments are:

- All elements belonging to one variable must be grouped together.
- Zero elements of A should not be specified.
- At least one element for each variable should be specified.

RHS (optional)

A record in this section has the format

[name]	[cname1]	[value1]	[cname2]	[value2]
--------	----------	----------	----------	----------

where the requirements for each field are as follows:

Field	Starting Position	Max Width	required	Description
[name]	5	8	Yes	Name of the RHS vector
[cname1]	15	8	Yes	Constraint name
[value1]	25	12	Yes	Numerical value
[cname2]	40	8	No	Constraint name
[value2]	50	12	No	Numerical value

The interpretation of a record is that [name] is the name of the RHS vector to be specified. In general, several vectors can be specified. [cname1] denotes a constraint name previously specified in the ROWS section. Now, assume that this name has been assigned to the i th constraint and v_1 denotes the value specified by [value1], then the interpretation of v_1 is:

Constraint	l_i^c	u_i^c
type		
E	v_1	v_1
G	v_1	
L		v_1
N		

An optional second element is specified by [cname2] and [value2] and is interpreted in the same way. Please note that it is not necessary to specify zero elements, because elements are assumed to be zero.

RANGES (optional)

A record in this section has the form

[name]	[cname1]	[value1]	[cname2]	[value2]
--------	----------	----------	----------	----------

where the requirements for each fields are as follows:

Field	Starting Position	Max Width	required	Description
[name]	5	8	Yes	Name of the RANGE vector
[cname1]	15	8	Yes	Constraint name
[value1]	25	12	Yes	Numerical value
[cname2]	40	8	No	Constraint name
[value2]	50	12	No	Numerical value

The records in this section are used to modify the bound vectors for the constraints, i.e. the values in l^c and u^c . A record has the following interpretation: [name] is the name of the RANGE vector and [cname1] is a valid constraint name. Assume that [cname1] is assigned to the i th constraint and let v_1 be the value specified by [value1], then a record has the interpretation:

Constraint type	Sign of v_1	l_i^c	u_i^c
E	—	$u_i^c + v_1$	
E	+		$l_i^c + v_1$
G	— or +	$l_i^c + v_1 $	
L	— or +	$u_i^c - v_1 $	
N			

QSECTION (optional)

Within the QSECTION the label [cname1] must be a constraint name previously specified in the ROWS section. The label [cname1] denotes the constraint to which the quadratic term belongs. A record in the QSECTION has the form

[vname1]	[vname2]	[value1]	[vname3]	[value2]
----------	----------	----------	----------	----------

where the requirements for each field are:

Field	Starting Position	Max Width	required	Description
[vname1]	5	8	Yes	Variable name
[vname2]	15	8	Yes	Variable name
[value1]	25	12	Yes	Numerical value
[vname3]	40	8	No	Variable name
[value2]	50	12	No	Numerical value

A record specifies one or two elements in the lower triangular part of the Q^i matrix where [cname1] specifies the i . Hence, if the names [vname1] and [vname2] have been assigned to the k th and j th variable, then Q_{kj}^i is assigned the value given by [value1]. An optional second element is specified in the same way by the fields [vname1], [vname3], and [value2].

The example

$$\begin{array}{ll} \text{minimize} & -x_2 + \frac{1}{2}(2x_1^2 - 2x_1x_3 + 0.2x_2^2 + 2x_3^2) \\ \text{subject to} & x_1 + x_2 + x_3 \geq 1, \\ & x \geq 0 \end{array}$$

has the following MPS file representation

```
* File: qo1.mps
NAME          qo1
ROWS
N  obj
G  c1
COLUMNS
x1      c1      1.0
x2      obj     -1.0
x2      c1      1.0
x3      c1      1.0
RHS
rhs      c1      1.0
QSECTION      obj
x1      x1      2.0
x1      x3     -1.0
x2      x2      0.2
x3      x3      2.0
ENDATA
```

Regarding the QSECTIONS please note that:

- Only one QSECTION is allowed for each constraint.
- The QSECTIONS can appear in an arbitrary order after the COLUMNS section.
- All variable names occurring in the QSECTION must already be specified in the COLUMNS section.
- All entries specified in a QSECTION are assumed to belong to the lower triangular part of the quadratic term of Q .

QMATRIX/QUADOBJ (optional)

The QMATRIX and QUADOBJ sections allow to define the quadratic term of the objective function. They differ in how the quadratic term of the objective function is stored:

- QMATRIX It stores all the nonzeros coefficients, without taking advantage of the symmetry of the Q matrix.
- QUADOBJ It only store the upper diagonal nonzero elements of the Q matrix.

A record in both sections has the form:

[vname1]	[vname2]	[value1]
----------	----------	----------

where the requirements for each field are:

Field	Starting Position	Max Width	required	Description
[vname1]	5	8	Yes	Variable name
[vname2]	15	8	Yes	Variable name
[value1]	25	12	Yes	Numerical value

A record specifies one elements of the Q matrix in the objective function. Hence, if the names [vname1] and [vname2] have been assigned to the k th and j th variable, then Q_{kj} is assigned the value given by [value1]. Note that a line must appear for each off-diagonal coefficient if using a QMATRIX section, while only one entry is required in a QUADOBJ section. The quadratic part of the objective function will be evaluated as $1/2x^T Qx$.

The example

$$\begin{aligned}
 &\text{minimize} && -x_2 + \frac{1}{2}(2x_1^2 - 2x_1x_3 + 0.2x_2^2 + 2x_3^2) \\
 &\text{subject to} && x_1 + x_2 + x_3 \geq 1, \\
 &&& x \geq 0
 \end{aligned}$$

has the following MPS file representation using QMATRIX

```

* File: qo1_matrix.mps
NAME          qo1_qmatrix
ROWS
  N  obj
  G  c1
COLUMNS
  x1      c1      1.0
  x2      obj     -1.0
  x2      c1      1.0
  x3      c1      1.0
RHS
  rhs     c1      1.0
QMATRIX
  x1      x1      2.0
  x1      x3     -1.0
  x3      x1     -1.0
  x2      x2      0.2
  x3      x3      2.0
ENDATA

```

or the following using QUADOBJ

```
* File: qo1_quadobj.mps
NAME          qo1_quadobj
ROWS
  N  obj
  G  c1
COLUMNS
  x1      c1      1.0
  x2      obj     -1.0
  x2      c1      1.0
  x3      c1      1.0
RHS
  rhs     c1      1.0
QUADOBJ
  x1      x1      2.0
  x1      x3     -1.0
  x2      x2      0.2
  x3      x3      2.0
ENDATA
```

Please also note that:

- A QMATRIX/QUADOBJ section can appear in an arbitrary order after the COLUMNS section.
- All variable names occurring in the QMATRIX/QUADOBJ section must already be specified in the COLUMNS section.

17.2.2 QCMATRIX (optional)

A QCMATRIX section allows to specify the quadratic part of a given constraints. Within the QCMATRIX the label [cname1] must be a constraint name previously specified in the ROWS section. The label [cname1] denotes the constraint to which the quadratic term belongs. A record in the QSECTION has the form

[vname1]	[vname2]	[value1]
----------	----------	----------

where the requirements for each field are:

Field	Starting Position	Max Width	required	Description
[vname1]	5	8	Yes	Variable name
[vname2]	15	8	Yes	Variable name
[value1]	25	12	Yes	Numerical value

A record specifies an entry of the Q^i matrix where [cname1] specifies the i . Hence, if the names [vname1] and [vname2] have been assigned to the k th and j th variable, then Q_{kj}^i is assigned the value given by [value1]. Moreover, the quadratic term is represented as $1/2x^T Qx$.

The example

$$\begin{aligned}
 &\text{minimize} && x_2 \\
 &\text{subject to} && x_1 + x_2 + x_3 \geq 1, \\
 & && \frac{1}{2}(-2x_1x_3 + 0.2x_2^2 + 2x_3^2) \leq 10, \\
 & && x \geq 0
 \end{aligned}$$

has the following MPS file representation

```
* File: qo1.mps
NAME          qo1
ROWS
  N  obj
  G  c1
  L  q1
COLUMNS
```

x1	c1	1.0
x2	obj	-1.0
x2	c1	1.0
x3	c1	1.0
RHS		
rhs	c1	1.0
rhs	q1	10.0
QCMATRIX		
	q1	
x1	x1	2.0
x1	x3	-1.0
x3	x1	-1.0
x2	x2	0.2
x3	x3	2.0
ENDATA		

Regarding the QCMATRIXs please note that:

- Only one QCMATRIX is allowed for each constraint.
- The QCMATRIXs can appear in an arbitrary order after the COLUMNS section.
- All variable names occurring in the QSECTION must already be specified in the COLUMNS section.
- A QCMATRIX does not exploit the symmetry of Q : an off-diagonal entry (i, j) should appear twice.

17.2.3 BOUNDS (optional)

In the BOUNDS section changes to the default bounds vectors l^x and u^x are specified. The default bounds vectors are $l^x = 0$ and $u^x = \infty$. Moreover, it is possible to specify several sets of bound vectors. A record in this section has the form

??	[name]	[vname1]	[value1]
----	--------	----------	----------

where the requirements for each field are:

Field	Starting Position	Max Width	Required	Description
??	2	2	Yes	Bound key
[name]	5	8	Yes	Name of the BOUNDS vector
[vname1]	15	8	Yes	Variable name
[value1]	25	12	No	Numerical value

Hence, a record in the BOUNDS section has the following interpretation: [name] is the name of the bound vector and [vname1] is the name of the variable which bounds are modified by the record. ?? and [value1] are used to modify the bound vectors according to the following table:

??	l_j^x	u_j^x	Made integer (added to \mathcal{J})
FR	$-\infty$	∞	No
FX	v_1	v_1	No
LO	v_1	unchanged	No
MI	$-\infty$	unchanged	No
PL	unchanged	∞	No
UP	unchanged	v_1	No
BV	0	1	Yes
LI	$\lceil v_1 \rceil$	unchanged	Yes
UI	unchanged	$\lfloor v_1 \rfloor$	Yes

v_1 is the value specified by [value1].

17.2.4 CSECTION (optional)

The purpose of the CSECTION is to specify the constraint

$$x \in \mathcal{K}.$$

in (17.2). It is assumed that \mathcal{K} satisfies the following requirements. Let

$$x^t \in \mathbb{R}^{n^t}, \quad t = 1, \dots, k$$

be vectors comprised of parts of the decision variables x so that each decision variable is a member of exactly **one** vector x^t , for example

$$x^1 = \begin{bmatrix} x_1 \\ x_4 \\ x_7 \end{bmatrix} \quad \text{and} \quad x^2 = \begin{bmatrix} x_6 \\ x_5 \\ x_3 \\ x_2 \end{bmatrix}.$$

Next define

$$\mathcal{K} := \{x \in \mathbb{R}^n : x^t \in \mathcal{K}_t, \quad t = 1, \dots, k\}$$

where \mathcal{K}_t must have one of the following forms

- \mathbb{R} set:

$$\mathcal{K}_t = \{x \in \mathbb{R}^{n^t}\}.$$

- Quadratic cone:

$$\mathcal{K}_t = \left\{ x \in \mathbb{R}^{n^t} : x_1 \geq \sqrt{\sum_{j=2}^{n^t} x_j^2} \right\}. \quad (17.3)$$

- Rotated quadratic cone:

$$\mathcal{K}_t = \left\{ x \in \mathbb{R}^{n^t} : 2x_1x_2 \geq \sum_{j=3}^{n^t} x_j^2, \quad x_1, x_2 \geq 0 \right\}. \quad (17.4)$$

In general, only quadratic and rotated quadratic cones are specified in the MPS file whereas membership of the \mathbb{R} set is not. If a variable is not a member of any other cone then it is assumed to be a member of an \mathbb{R} cone.

Next, let us study an example. Assume that the quadratic cone

$$x_4 \geq \sqrt{x_5^2 + x_8^2}$$

and the rotated quadratic cone

$$x_3x_7 \geq x_1^2 + x_0^2, \quad x_3, x_7 \geq 0,$$

should be specified in the MPS file. One CSECTION is required for each cone and they are specified as follows:

*	1	2	3	4	5	6
*23456789012345678901234567890123456789012345678901234567890						
CSECTION	konea	0.0	QUAD			
x4						
x5						
x8						
CSECTION	koneb	0.0	RQUAD			
x7						
x3						
x1						
x0						

This first CSECTION specifies the cone (17.3) which is given the name `konea`. This is a quadratic cone which is specified by the keyword `QUAD` in the CSECTION header. The 0.0 value in the CSECTION header is not used by the `QUAD` cone.

The second CSECTION specifies the rotated quadratic cone (17.4). Please note the keyword `RQUAD` in the CSECTION which is used to specify that the cone is a rotated quadratic cone instead of a quadratic cone. The 0.0 value in the CSECTION header is not used by the `RQUAD` cone.

In general, a CSECTION header has the format

CSECTION	[kname1]	[value1]	[ktype]
----------	----------	----------	---------

where the requirement for each field are as follows:

Field	Starting Position	Max Width	Required	Description
[kname1]	5	8	Yes	Name of the cone
[value1]	15	12	No	Cone parameter
[ktype]	25		Yes	Type of the cone.

The possible cone type keys are:

Cone type key	Members	Interpretation.
QUAD	≤ 1	Quadratic cone i.e. (17.3).
RQUAD	≤ 2	Rotated quadratic cone i.e. (17.4).

Please note that a quadratic cone must have at least one member whereas a rotated quadratic cone must have at least two members. A record in the CSECTION has the format

[vname1]

where the requirements for each field are

Field	Starting Position	Max Width	required	Description
[vname1]	2	8	Yes	A valid variable name

The most important restriction with respect to the CSECTION is that a variable must occur in only one CSECTION.

17.2.5 ENDATA

This keyword denotes the end of the MPS file.

17.2.6 Integer Variables

Using special bound keys in the BOUNDS section it is possible to specify that some or all of the variables should be integer-constrained i.e. be members of \mathcal{J} . However, an alternative method is available.

This method is available only for backward compatibility and we recommend that it is not used. This method requires that markers are placed in the COLUMNS section as in the example:

```
COLUMNS
x1      obj      -10.0          c1      0.7
x1      c2        0.5          c3      1.0
x1      c4        0.1
* Start of integer-constrained variables.
MARK000  'MARKER'          'INTORG'
x2      obj      -9.0          c1      1.0
x2      c2      0.833333333333 c3      0.66666667
x2      c4        0.25
x3      obj      1.0          c6      2.0
MARK001  'MARKER'          'INTEND'
```

- End of integer-constrained variables.

Please note that special marker lines are used to indicate the start and the end of the integer variables. Furthermore be aware of the following

- **IMPORTANT:** All variables between the markers are assigned a default lower bound of 0 and a default upper bound of 1. **This may not be what is intended.** If it is not intended, the correct bounds should be defined in the `BOUNDS` section of the MPS formatted file.
- **MOSEK** ignores field 1, i.e. `MARK0001` and `MARK001`, however, other optimization systems require them.
- Field 2, i.e. `MARKER`, must be specified including the single quotes. This implies that no row can be assigned the name `MARKER`.
- Field 3 is ignored and should be left blank.
- Field 4, i.e. `INTORG` and `INTEND`, must be specified.
- It is possible to specify several such integer marker sections within the `COLUMNS` section.

17.2.7 General Limitations

- An MPS file should be an ASCII file.

17.2.8 Interpretation of the MPS Format

Several issues related to the MPS format are not well-defined by the industry standard. However, **MOSEK** uses the following interpretation:

- If a matrix element in the `COLUMNS` section is specified multiple times, then the multiple entries are added together.
- If a matrix element in a `QSECTION` section is specified multiple times, then the multiple entries are added together.

17.2.9 The Free MPS Format

MOSEK supports a free format variation of the MPS format. The free format is similar to the MPS file format but less restrictive, e.g. it allows longer names. However, it also presents two main limitations:

- A name must not contain any blanks.
- By default a line in the MPS file must not contain more than 1024 characters. However, by modifying the parameter `MSK_IPAR_READ_MPS_WIDTH` an arbitrary large line width will be accepted.

To use the free MPS format instead of the default MPS format the **MOSEK** parameter `MSK_IPAR_READ_MPS_FORMAT` should be changed.

17.3 The OPF Format

The *Optimization Problem Format (OPF)* is an alternative to LP and MPS files for specifying optimization problems. It is row-oriented, inspired by the CPLEX LP format.

Apart from containing objective, constraints, bounds etc. it may contain complete or partial solutions, comments and extra information relevant for solving the problem. It is designed to be easily read and modified by hand and to be forward compatible with possible future extensions.

Intended use

The OPF file format is meant to replace several other files:

- The LP file format: Any problem that can be written as an LP file can be written as an OPF file too; furthermore it naturally accommodates ranged constraints and variables as well as arbitrary characters in names, fixed expressions in the objective, empty constraints, and conic constraints.
- Parameter files: It is possible to specify integer, double and string parameters along with the problem (or in a separate OPF file).
- Solution files: It is possible to store a full or a partial solution in an OPF file and later reload it.

17.3.1 The File Format

The format uses tags to structure data. A simple example with the basic sections may look like this:

```
[comment]
This is a comment. You may write almost anything here...
[/comment]

# This is a single-line comment.

[objective min 'myobj']
x + 3 y + x^2 + 3 y^2 + z + 1
[/objective]

[constraints]
[con 'con01'] 4 <= x + y  [/con]
[/constraints]

[bounds]
[b] -10 <= x,y <= 10  [/b]

[cone quad] x,y,z  [/cone]
[/bounds]
```

A scope is opened by a tag of the form `[tag]` and closed by a tag of the form `[/tag]`. An opening tag may accept a list of unnamed and named arguments, for examples:

```
[tag value] tag with one unnamed argument [/tag]
[tag arg=value] tag with one named argument in quotes [/tag]
```

Unnamed arguments are identified by their order, while named arguments may appear in any order, but never before an unnamed argument. The `value` can be a quoted, single-quoted or double-quoted text string, i.e.

```
[tag 'value']      single-quoted value [/tag]
[tag arg='value']  single-quoted value [/tag]
[tag "value"]      double-quoted value [/tag]
[tag arg="value"]  double-quoted value [/tag]
```

Sections

The recognized tags are

[comment]

A comment section. This can contain *almost* any text: Between single quotes (') or double quotes (") any text may appear. Outside quotes the markup characters ([and]) must be prefixed by backslashes. Both single and double quotes may appear alone or inside a pair of quotes if it is prefixed by a backslash.

[objective]

The objective function: This accepts one or two parameters, where the first one (in the above example `min`) is either `min` or `max` (regardless of case) and defines the objective sense, and the second one (above `myobj`), if present, is the objective name. The section may contain linear and quadratic expressions. If several objectives are specified, all but the last are ignored.

[constraints]

This does not directly contain any data, but may contain the subsection `con` defining a linear constraint.

[`con`] defines a single constraint; if an argument is present ([`con NAME`]) this is used as the name of the constraint, otherwise it is given a null-name. The section contains a constraint definition written as linear and quadratic expressions with a lower bound, an upper bound, with both or with an equality. Examples:

```
[constraints]
[con 'con1'] 0 <= x + y      [/con]
[con 'con2'] 0 >= x + y      [/con]
[con 'con3'] 0 <= x + y <= 10 [/con]
[con 'con4']      x + y = 10 [/con]
[/constraints]
```

Constraint names are unique. If a constraint is specified which has the same name as a previously defined constraint, the new constraint replaces the existing one.

[bounds]

This does not directly contain any data, but may contain the subsections `b` (linear bounds on variables) and `cone` (quadratic cone).

[`b`]. Bound definition on one or several variables separated by comma (,). An upper or lower bound on a variable replaces any earlier defined bound on that variable. If only one bound (upper or lower) is given only this bound is replaced. This means that upper and lower bounds can be specified separately. So the OPF bound definition:

```
[b] x,y >= -10 [/b]
[b] x,y <= 10  [/b]
```

results in the bound $-10 \leq x, y \leq 10$.

[`cone`]. currently supports the *quadratic cone* and the *rotated quadratic cone*.

A conic constraint is defined as a set of variables which belong to a single unique cone.

- A quadratic cone of n variables x_1, \dots, x_n defines a constraint of the form

$$x_1^2 > \sum_{i=2}^n x_i^2.$$

- A rotated quadratic cone of n variables x_1, \dots, x_n defines a constraint of the form

$$x_1 x_2 > \sum_{i=3}^n x_i^2.$$

A `[bounds]`-section example:

```
[bounds]
[b]  0 <= x,y <= 10  [/b] # ranged bound
[b] 10 >= x,y >=  0  [/b] # ranged bound
[b]  0 <= x,y <= inf [/b] # using inf
[b]      x,y free    [/b] # free variables
# Let (x,y,z,w) belong to the cone K
[cone quad] x,y,z,w  [/cone] # quadratic cone
[cone rquad] x,y,z,w [/cone] # rotated quadratic cone
[/bounds]
```

By default all variables are free.

`[variables]`

This defines an ordering of variables as they should appear in the problem. This is simply a space-separated list of variable names.

`[integer]`

This contains a space-separated list of variables and defines the constraint that the listed variables must be integer values.

`[hints]`

This may contain only non-essential data; for example estimates of the number of variables, constraints and non-zeros. Placed before all other sections containing data this may reduce the time spent reading the file.

In the `hints` section, any subsection which is not recognized by **MOSEK** is simply ignored. In this section a hint in a subsection is defined as follows:

```
[hint ITEM] value [/hint]
```

where `ITEM` may be replaced by `numvar` (number of variables), `numcon` (number of linear/quadratic constraints), `numanz` (number of linear non-zeros in constraints) and `numqnz` (number of quadratic non-zeros in constraints).

`[solutions]`

This section can contain a set of full or partial solutions to a problem. Each solution must be specified using a `[solution]`-section, i.e.

```
[solutions]
[solution]...[/solution] #solution 1
[solution]...[/solution] #solution 2
#other solutions....
[solution]...[/solution] #solution n
[/solutions]
```

Note that a `[solution]`-section must be always specified inside a `[solutions]`-section. The syntax of a `[solution]`-section is the following:

```
[solution SOLTYPE status=STATUS]...[/solution]
```

where `SOLTYPE` is one of the strings

- `interior`, a non-basic solution,
- `basic`, a basic solution,
- `integer`, an integer solution,

and `STATUS` is one of the strings

- `UNKNOWN`,
- `OPTIMAL`,
- `INTEGER_OPTIMAL`,
- `PRIM_FEAS`,
- `DUAL_FEAS`,
- `PRIM_AND_DUAL_FEAS`,
- `NEAR_OPTIMAL`,
- `NEAR_PRIM_FEAS`,
- `NEAR_DUAL_FEAS`,
- `NEAR_PRIM_AND_DUAL_FEAS`,
- `PRIM_INFEAS_CER`,
- `DUAL_INFEAS_CER`,
- `NEAR_PRIM_INFEAS_CER`,
- `NEAR_DUAL_INFEAS_CER`,
- `NEAR_INTEGER_OPTIMAL`.

Most of these values are irrelevant for input solutions; when constructing a solution for simplex hot-start or an initial solution for a mixed integer problem the safe setting is `UNKNOWN`.

A `[solution]`-section contains `[con]` and `[var]` sections. Each `[con]` and `[var]` section defines solution information for a single variable or constraint, specified as list of `KEYWORD/value` pairs, in any order, written as

```
KEYWORD=value
```

Allowed keywords are as follows:

- `sk`. The status of the item, where the `value` is one of the following strings:
 - `LOW`, the item is on its lower bound.
 - `UPR`, the item is on its upper bound.
 - `FIX`, it is a fixed item.
 - `BAS`, the item is in the basis.

- SUPBAS, the item is super basic.
- UNK, the status is unknown.
- INF, the item is outside its bounds (infeasible).
- **lv1** Defines the level of the item.
- **s1** Defines the level of the dual variable associated with its lower bound.
- **su** Defines the level of the dual variable associated with its upper bound.
- **sn** Defines the level of the variable associated with its cone.
- **y** Defines the level of the corresponding dual variable (for constraints only).

A **[var]** section should always contain the items **sk**, **lv1**, **s1** and **su**. Items **s1** and **su** are not required for **integer** solutions.

A **[con]** section should always contain **sk**, **lv1**, **s1**, **su** and **y**.

An example of a solution section

```
[solution basic status=UNKNOWN]
[var x0] sk=LOW    lv1=5.0      [/var]
[var x1] sk=UPR    lv1=10.0     [/var]
[var x2] sk=SUPBAS lv1=2.0    s1=1.5 su=0.0 [/var]

[con c0] sk=LOW    lv1=3.0 y=0.0 [/con]
[con c0] sk=UPR    lv1=0.0 y=5.0 [/con]
[/solution]
```

- **[vendor]** This contains solver/vendor specific data. It accepts one argument, which is a vendor ID – for **MOSEK** the ID is simply **mosek** – and the section contains the subsection **parameters** defining solver parameters. When reading a vendor section, any unknown vendor can be safely ignored. This is described later.

Comments using the **#** may appear anywhere in the file. Between the **#** and the following line-break any text may be written, including markup characters.

Numbers

Numbers, when used for parameter values or coefficients, are written in the usual way by the **printf** function. That is, they may be prefixed by a sign (+ or -) and may contain an integer part, decimal part and an exponent. The decimal point is always **.** (a dot). Some examples are

```
1
1.0
.0
1.
1e10
1e+10
1e-10
```

Some *invalid* examples are

```
e10 # invalid, must contain either integer or decimal part
.   # invalid
.e10 # invalid
```

More formally, the following standard regular expression describes numbers as used:

```
[+|-]?([0-9]+[.][0-9]*|.[0-9]+)([eE][+|-]?[0-9]+)?
```

Names

Variable names, constraint names and objective name may contain arbitrary characters, which in some cases must be enclosed by quotes (single or double) that in turn must be preceded by a backslash. Unquoted names must begin with a letter (a-z or A-Z) and contain only the following characters: the letters a-z and A-Z, the digits 0-9, braces { and } and underscore (_).

Some examples of legal names:

```
an_unquoted_name
another_name{123}
'single quoted name'
"double quoted name"
"name with \"quote\" in it"
"name with []s in it"
```

17.3.2 Parameters Section

In the `vendor` section solver parameters are defined inside the `parameters` subsection. Each parameter is written as

```
[p PARAMETER_NAME] value [/p]
```

where `PARAMETER_NAME` is replaced by a **MOSEK** parameter name, usually of the form `MSK_IPAR_...`, `MSK_DPAR_...` or `MSK_SPAR_...`, and the `value` is replaced by the value of that parameter; both integer values and named values may be used. Some simple examples are

```
[vendor mosek]
[parameters]
[p MSK_IPAR_OPF_MAX_TERMS_PER_LINE] 10      [/p]
[p MSK_IPAR_OPF_WRITE_PARAMETERS]    MSK_ON [/p]
[p MSK_DPAR_DATA_TOL_BOUND_INF]      1.0e18 [/p]
[/parameters]
[/vendor]
```

17.3.3 Writing OPF Files from MOSEK

To write an OPF file set the parameter `MSK_IPAR_WRITE_DATA_FORMAT` to `MSK_DATA_FORMAT_OP` as this ensures that OPF format is used.

Then modify the following parameters to define what the file should contain:

<code>MSK_IPAR_OPF_WRITE_SOL_BAS</code>	Include basic solution, if defined.
<code>MSK_IPAR_OPF_WRITE_SOL_ITG</code>	Include integer solution, if defined.
<code>MSK_IPAR_OPF_WRITE_SOL_ITR</code>	Include interior solution, if defined.
<code>MSK_IPAR_OPF_WRITE_SOLUTIONS</code>	Include solutions if they are defined. If this is off, no solutions are included.
<code>MSK_IPAR_OPF_WRITE_HEADER</code>	Include a small header with comments.
<code>MSK_IPAR_OPF_WRITE_PROBLEM</code>	Include the problem itself — objective, constraints and bounds.
<code>MSK_IPAR_OPF_WRITE_PARAMETERS</code>	Include all parameter settings.
<code>MSK_IPAR_OPF_WRITE_HINTS</code>	Include hints about the size of the problem.

17.3.4 Examples

This section contains a set of small examples written in OPF and describing how to formulate linear, quadratic and conic problems.

Linear Example lo1.opf

Consider the example:

$$\begin{array}{llllll} \text{maximize} & 3x_0 & + & 1x_1 & + & 5x_2 & + & 1x_3 \\ \text{subject to} & 3x_0 & + & 1x_1 & + & 2x_2 & & = & 30, \\ & 2x_0 & + & 1x_1 & + & 3x_2 & + & 1x_3 & \geq & 15, \\ & & & 2x_1 & & & + & 3x_3 & \leq & 25, \end{array}$$

having the bounds

$$\begin{array}{lll} 0 & \leq & x_0 \leq \infty, \\ 0 & \leq & x_1 \leq 10, \\ 0 & \leq & x_2 \leq \infty, \\ 0 & \leq & x_3 \leq \infty. \end{array}$$

In the OPF format the example is displayed as shown in [Listing 17.1](#).

Listing 17.1: Example of an OPF file for a linear problem.

```
[comment]
  The lo1 example in OPF format
[/comment]

[hints]
  [hint NUMVAR] 4 [/hint]
  [hint NUMCON] 3 [/hint]
  [hint NUMANZ] 9 [/hint]
[/hints]

[variables disallow_new_variables]
  x1 x2 x3 x4
[/variables]

[objective maximize 'obj']
  3 x1 + x2 + 5 x3 + x4
[/objective]

[constraints]
  [con 'c1'] 3 x1 +   x2 + 2 x3           = 30 [/con]
  [con 'c2'] 2 x1 +   x2 + 3 x3 +   x4 >= 15 [/con]
  [con 'c3']      2 x2           + 3 x4 <= 25 [/con]
[/constraints]

[bounds]
  [b] 0 <= * [/b]
  [b] 0 <= x2 <= 10 [/b]
[/bounds]
```

Quadratic Example qo1.opf

An example of a quadratic optimization problem is

$$\begin{array}{ll} \text{minimize} & x_1^2 + 0.1x_2^2 + x_3^2 - x_1x_3 - x_2 \\ \text{subject to} & 1 \leq x_1 + x_2 + x_3, \\ & x \geq 0. \end{array}$$

This can be formulated in `opf` as shown below.

Listing 17.2: Example of an OPF file for a quadratic problem.

```
[comment]
  The qo1 example in OPF format
[/comment]

[hints]
  [hint NUMVAR] 3 [/hint]
  [hint NUMCON] 1 [/hint]
  [hint NUMANZ] 3 [/hint]
  [hint NUMQNZ] 4 [/hint]
[/hints]

[variables disallow_new_variables]
  x1 x2 x3
[/variables]

[objective minimize 'obj']
  # The quadratic terms are often written with a factor of 1/2 as here,
  # but this is not required.

  - x2 + 0.5 ( 2.0 x1 ^ 2 - 2.0 x3 * x1 + 0.2 x2 ^ 2 + 2.0 x3 ^ 2 )
[/objective]

[constraints]
  [con 'c1'] 1.0 <= x1 + x2 + x3 [/con]
[/constraints]

[bounds]
  [b] 0 <= * [/b]
[/bounds]
```

Conic Quadratic Example cqo1.opf

Consider the example:

$$\begin{aligned}
 &\text{minimize} && x_3 + x_4 + x_5 \\
 &\text{subject to} && x_0 + x_1 + 2x_2 = 1, \\
 & && x_0, x_1, x_2 \geq 0, \\
 & && x_3 \geq \sqrt{x_0^2 + x_1^2}, \\
 & && 2x_4x_5 \geq x_2^2.
 \end{aligned}$$

Please note that the type of the cones is defined by the parameter to `[cone ...]`; the content of the cone-section is the names of variables that belong to the cone. The resulting OPF file is in [Listing 17.3](#).

Listing 17.3: Example of an OPF file for a conic quadratic problem.

```
[comment]
  The cqo1 example in OPF format.
[/comment]

[hints]
  [hint NUMVAR] 6 [/hint]
  [hint NUMCON] 1 [/hint]
  [hint NUMANZ] 3 [/hint]
[/hints]

[variables disallow_new_variables]
  x1 x2 x3 x4 x5 x6
[/variables]
```

```

[objective minimize 'obj']
  x4 + x5 + x6
[/objective]

[constraints]
  [con 'c1']  x1 + x2 + 2e+00 x3 = 1e+00 [/con]
[/constraints]

[bounds]
  # We let all variables default to the positive orthant
  [b] 0 <= * [/b]

  # ...and change those that differ from the default
  [b] x4,x5,x6 free [/b]

  # Define quadratic cone:  $x_4 \geq \sqrt{x_1^2 + x_2^2}$ 
  [cone quad 'k1'] x4, x1, x2 [/cone]

  # Define rotated quadratic cone:  $2 x_5 x_6 \geq x_3^2$ 
  [cone rquad 'k2'] x5, x6, x3 [/cone]
[/bounds]

```

Mixed Integer Example `mil01.opf`

Consider the mixed integer problem:

$$\begin{aligned}
 &\text{maximize} && x_0 + 0.64x_1 \\
 &\text{subject to} && 50x_0 + 31x_1 \leq 250, \\
 & && 3x_0 - 2x_1 \geq -4, \\
 & && x_0, x_1 \geq 0 \quad \text{and integer}
 \end{aligned}$$

This can be implemented in OPF with the file in [Listing 17.4](#).

Listing 17.4: Example of an OPF file for a mixed-integer linear problem.

```

[comment]
  The mil01 example in OPF format
[/comment]

[hints]
  [hint NUMVAR] 2 [/hint]
  [hint NUMCON] 2 [/hint]
  [hint NUMANZ] 4 [/hint]

  x1 x2
[/variables]

[objective maximize 'obj']
  x1 + 6.4e-1 x2
[/objective]

[constraints]
  [con 'c1'] 5e+1 x1 + 3.1e+1 x2 <= 2.5e+2 [/con]
  [con 'c2'] -4 <= 3 x1 - 2 x2 [/con]
[/constraints]

[bounds]
  [b] 0 <= * [/b]
[/bounds]

```

```
[integer]
  x1 x2
[/integer]
```

17.4 The CBF Format

This document constitutes the technical reference manual of the *Conic Benchmark Format* with file extension: `.cbf` or `.CBF`. It unifies linear, second-order cone (also known as conic quadratic) and semidefinite optimization with mixed-integer variables. The format has been designed with benchmark libraries in mind, and therefore focuses on compact and easily parsable representations. The problem structure is separated from the problem data, and the format moreover facilitates benchmarking of hotstart capability through sequences of changes.

17.4.1 How Instances Are Specified

This section defines the spectrum of conic optimization problems that can be formulated in terms of the keywords of the CBF format.

In the CBF format, conic optimization problems are considered in the following form:

$$\begin{aligned}
 & \min / \max && g^{obj} \\
 & \text{s.t.} && \begin{aligned} & g_i \in \mathcal{K}_i, & i \in \mathcal{I}, \\ & G_i \in \mathcal{K}_i, & i \in \mathcal{I}^{PSD}, \\ & x_j \in \mathcal{K}_j, & j \in \mathcal{J}, \\ & \bar{X}_j \in \mathcal{K}_j, & j \in \mathcal{J}^{PSD}. \end{aligned}
 \end{aligned} \tag{17.5}$$

- **Variables** are either scalar variables, x_j for $j \in \mathcal{J}$, or variables, \bar{X}_j for $j \in \mathcal{J}^{PSD}$. Scalar variables can also be declared as integer.
- **Constraints** are affine expressions of the variables, either scalar-valued g_i for $i \in \mathcal{I}$, or matrix-valued G_i for $i \in \mathcal{I}^{PSD}$

$$\begin{aligned}
 g_i &= \sum_{j \in \mathcal{J}^{PSD}} \langle F_{ij}, X_j \rangle + \sum_{j \in \mathcal{J}} a_{ij} x_j + b_i, \\
 G_i &= \sum_{j \in \mathcal{J}} x_j H_{ij} + D_i.
 \end{aligned}$$

- The **objective function** is a scalar-valued affine expression of the variables, either to be minimized or maximized. We refer to this expression as g^{obj}

$$g^{obj} = \sum_{j \in \mathcal{J}^{PSD}} \langle F_j^{obj}, X_j \rangle + \sum_{j \in \mathcal{J}} a_j^{obj} x_j + b^{obj}.$$

CBF format can represent the following cones \mathcal{K} :

- **Free domain** - A cone in the linear family defined by

$$\{x \in \mathbb{R}^n\}, \text{ for } n \geq 1.$$

- **Positive orthant** - A cone in the linear family defined by

$$\{x \in \mathbb{R}^n \mid x_j \geq 0 \text{ for } j = 1, \dots, n\}, \text{ for } n \geq 1.$$

- **Negative orthant** - A cone in the linear family defined by

$$\{x \in \mathbb{R}^n \mid x_j \leq 0 \text{ for } j = 1, \dots, n\}, \text{ for } n \geq 1.$$

- **Fixpoint zero** - A cone in the linear family defined by

$$\{x \in \mathbb{R}^n \mid x_j = 0 \text{ for } j = 1, \dots, n\}, \text{ for } n \geq 1.$$

- **Quadratic cone** - A cone in the second-order cone family defined by

$$\left\{ \begin{pmatrix} p \\ x \end{pmatrix} \in \mathbb{R} \times \mathbb{R}^{n-1}, p^2 \geq x^T x, p \geq 0 \right\}, \text{ for } n \geq 2.$$

- **Rotated quadratic cone** - A cone in the second-order cone family defined by

$$\left\{ \begin{pmatrix} p \\ q \\ x \end{pmatrix} \in \mathbb{R} \times \mathbb{R} \times \mathbb{R}^{n-2}, 2pq \geq x^T x, p \geq 0, q \geq 0 \right\}, \text{ for } n \geq 3.$$

17.4.2 The Structure of CBF Files

This section defines how information is written in the CBF format, without being specific about the type of information being communicated.

All information items belong to exactly one of the three groups of information. These information groups, and the order they must appear in, are:

1. File format.
2. Problem structure.
3. Problem data.

The first group, file format, provides information on how to interpret the file. The second group, problem structure, provides the information needed to deduce the type and size of the problem instance. Finally, the third group, problem data, specifies the coefficients and constants of the problem instance.

Information items

The format is composed as a list of information items. The first line of an information item is the **KEYWORD**, revealing the type of information provided. The second line - of some keywords only - is the **HEADER**, typically revealing the size of information that follows. The remaining lines are the **BODY** holding the actual information to be specified.

KEYWORD
BODY
KEYWORD
HEADER
BODY

The **KEYWORD** determines how each line in the **HEADER** and **BODY** is structured. Moreover, the number of lines in the **BODY** follows either from the **KEYWORD**, the **HEADER**, or from another information item required to precede it.

Embedded hotstart-sequences

A sequence of problem instances, based on the same problem structure, is within a single file. This is facilitated via the **CHANGE** within the problem data information group, as a separator between the information items of each instance. The information items following a **CHANGE** keyword are appending to, or changing (e.g., setting coefficients back to their default value of zero), the problem data of the preceding instance.

The sequence is intended for benchmarking of hotstart capability, where the solvers can reuse their internal state and solution (subject to the achieved accuracy) as warmpoint for the succeeding instance. Whenever this feature is unsupported or undesired, the keyword **CHANGE** should be interpreted as the end of file.

File encoding and line width restrictions

The format is based on the US-ASCII printable character set with two extensions as listed below. Note, by definition, that none of these extensions can be misinterpreted as printable US-ASCII characters:

- A line feed marks the end of a line, carriage returns are ignored.
- Comment-lines may contain unicode characters in UTF-8 encoding.

The line width is restricted to 512 bytes, with 3 bytes reserved for the potential carriage return, line feed and null-terminator.

Integers and floating point numbers must follow the ISO C decimal string representation in the standard C locale. The format does not impose restrictions on the magnitude of, or number of significant digits in numeric data, but the use of 64-bit integers and 64-bit IEEE 754 floating point numbers should be sufficient to avoid loss of precision.

Comment-line and whitespace rules

The format allows single-line comments respecting the following rule:

- Lines having first byte equal to '#' (US-ASCII 35) are comments, and should be ignored. Comments are only allowed between information items.

Given that a line is not a comment-line, whitespace characters should be handled according to the following rules:

- Leading and trailing whitespace characters should be ignored.
 - The separator between multiple pieces of information on one line, is either one or more whitespace characters.
- Lines containing only whitespace characters are empty, and should be ignored. Empty lines are only allowed between information items.

17.4.3 Problem Specification

The problem structure

The problem structure defines the objective sense, whether it is minimization and maximization. It also defines the index sets, \mathcal{J} , \mathcal{J}^{PSD} , \mathcal{I} and \mathcal{I}^{PSD} , which are all numbered from zero, $\{0, 1, \dots\}$, and empty until explicitly constructed.

- **Scalar variables** are constructed in vectors restricted to a conic domain, such as $(x_0, x_1) \in \mathbb{R}_+^2$, $(x_2, x_3, x_4) \in \mathcal{Q}^3$, etc. In terms of the Cartesian product, this generalizes to

$$x \in \mathcal{K}_1^{n_1} \times \mathcal{K}_2^{n_2} \times \dots \times \mathcal{K}_k^{n_k}$$

which in the CBF format becomes:

```
VAR
n k
K1 n1
K2 n2
...
Kk nk
```

where $\sum_i n_i = n$ is the total number of scalar variables. The list of supported cones is found in [Table 17.3](#). Integrality of scalar variables can be specified afterwards.

- **PSD variables** are constructed one-by-one. That is, $X_j \succeq \mathbf{0}^{n_j \times n_j}$ for $j \in \mathcal{J}^{PSD}$, constructs a matrix-valued variable of size $n_j \times n_j$ restricted to be symmetric positive semidefinite. In the CBF format, this list of constructions becomes:

```
PSDVAR
N
n1
n2
...
nN
```

where N is the total number of PSD variables.

- **Scalar constraints** are constructed in vectors restricted to a conic domain, such as $(g_0, g_1) \in \mathbb{R}_+^2$, $(g_2, g_3, g_4) \in \mathcal{Q}^3$, etc. In terms of the Cartesian product, this generalizes to

$$g \in \mathcal{K}_1^{m_1} \times \mathcal{K}_2^{m_2} \times \dots \times \mathcal{K}_k^{m_k}$$

which in the CBF format becomes:

```
CON
m k
K1 m1
K2 m2
..
Kk mk
```

where $\sum_i m_i = m$ is the total number of scalar constraints. The list of supported cones is found in [Table 17.3](#).

- **PSD constraints** are constructed one-by-one. That is, $G_i \succeq \mathbf{0}^{m_i \times m_i}$ for $i \in \mathcal{I}^{PSD}$, constructs a matrix-valued affine expressions of size $m_i \times m_i$ restricted to be symmetric positive semidefinite. In the CBF format, this list of constructions becomes

```
PSDCON
M
m1
m2
..
mM
```

where M is the total number of PSD constraints.

With the objective sense, variables (with integer indications) and constraints, the definitions of the many affine expressions follow in problem data.

Problem data

The problem data defines the coefficients and constants of the affine expressions of the problem instance. These are considered zero until explicitly defined, implying that instances with no keywords from this

information group are, in fact, valid. Duplicating or conflicting information is a failure to comply with the standard. Consequently, two coefficients written to the same position in a matrix (or to transposed positions in a symmetric matrix) is an error.

The affine expressions of the objective, g^{obj} , of the scalar constraints, g_i , and of the PSD constraints, G_i , are defined separately. The following notation uses the standard trace inner product for matrices, $\langle X, Y \rangle = \sum_{i,j} X_{ij}Y_{ij}$.

- The affine expression of the objective is defined as

$$g^{obj} = \sum_{j \in \mathcal{J}^{PSD}} \langle F_j^{obj}, X_j \rangle + \sum_{j \in \mathcal{J}} a_j^{obj} x_j + b^{obj},$$

in terms of the symmetric matrices, F_j^{obj} , and scalars, a_j^{obj} and b^{obj} .

- The affine expressions of the scalar constraints are defined, for $i \in \mathcal{I}$, as

$$g_i = \sum_{j \in \mathcal{J}^{PSD}} \langle F_{ij}, X_j \rangle + \sum_{j \in \mathcal{J}} a_{ij} x_j + b_i,$$

in terms of the symmetric matrices, F_{ij} , and scalars, a_{ij} and b_i .

- The affine expressions of the PSD constraints are defined, for $i \in \mathcal{I}^{PSD}$, as

$$G_i = \sum_{j \in \mathcal{J}} x_j H_{ij} + D_i,$$

in terms of the symmetric matrices, H_{ij} and D_i .

List of cones

The format uses an explicit syntax for symmetric positive semidefinite cones as shown above. For scalar variables and constraints, constructed in vectors, the supported conic domains and their minimum sizes are given as follows.

Table 17.3: Cones available in the CBF format

Name	CBF keyword	Cone family
Free domain	F	linear
Positive orthant	L+	linear
Negative orthant	L-	linear
Fixpoint zero	L=	linear
Quadratic cone	Q	second-order
Rotated quadratic cone	QR	second-order

17.4.4 File Format Keywords

VER

Description: The version of the Conic Benchmark Format used to write the file.

HEADER: None

BODY: One line formatted as:

INT

This is the version number.

Must appear exactly once in a file, as the first keyword.

OBJSENSE

Description: Define the objective sense.

HEADER: None

BODY: One line formatted as:

STR

having MIN indicates minimize, and MAX indicates maximize. Capital letters are required.

Must appear exactly once in a file.

PSDVAR

Description: Construct the PSD variables.

HEADER: One line formatted as:

INT

This is the number of PSD variables in the problem.

BODY: A list of lines formatted as:

INT

This indicates the number of rows (equal to the number of columns) in the matrix-valued PSD variable. The number of lines should match the number stated in the header.

VAR

Description: Construct the scalar variables.

HEADER: One line formatted as:

INT INT

This is the number of scalar variables, followed by the number of conic domains they are restricted to.

BODY: A list of lines formatted as:

STR INT

This indicates the cone name (see [Table 17.3](#)), and the number of scalar variables restricted to this cone. These numbers should add up to the number of scalar variables stated first in the header. The number of lines should match the second number stated in the header.

INT

Description: Declare integer requirements on a selected subset of scalar variables.

HEADER: one line formatted as:

INT

This is the number of integer scalar variables in the problem.

BODY: a list of lines formatted as:

INT

This indicates the scalar variable index $j \in \mathcal{J}$. The number of lines should match the number stated in the header.

Can only be used after the keyword **VAR**.

PSDCON

Description: Construct the PSD constraints.

HEADER: One line formatted as:

INT

This is the number of PSD constraints in the problem.

BODY: A list of lines formatted as:

INT

This indicates the number of rows (equal to the number of columns) in the matrix-valued affine expression of the PSD constraint. The number of lines should match the number stated in the header.

Can only be used after these keywords: **PSDVAR**, **VAR**.

CON

Description: Construct the scalar constraints.

HEADER: One line formatted as:

INT INT

This is the number of scalar constraints, followed by the number of conic domains they restrict to.

BODY: A list of lines formatted as:

STR INT

This indicates the cone name (see [Table 17.3](#)), and the number of affine expressions restricted to this cone. These numbers should add up to the number of scalar constraints stated first in the header. The number of lines should match the second number stated in the header.

Can only be used after these keywords: **PSDVAR**, **VAR**

OBJFCOORD

Description: Input sparse coordinates (quadruplets) to define the symmetric matrices F_j^{obj} , as used in the objective.

HEADER: One line formatted as:

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as:

INT INT INT REAL

This indicates the PSD variable index $j \in \mathcal{J}^{PSD}$, the row index, the column index and the coefficient value. The number of lines should match the number stated in the header.

OBJACOORD

Description: Input sparse coordinates (pairs) to define the scalars, a_j^{obj} , as used in the objective.

HEADER: One line formatted as:

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as:

INT REAL

This indicates the scalar variable index $j \in \mathcal{J}$ and the coefficient value. The number of lines should match the number stated in the header.

OBJBCOORD

Description: Input the scalar, b^{obj} , as used in the objective.

HEADER: None.

BODY: One line formatted as:

REAL

This indicates the coefficient value.

FCOORD

Description: Input sparse coordinates (quintuplets) to define the symmetric matrices, F_{ij} , as used in the scalar constraints.

HEADER: One line formatted as:

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as:

INT INT INT INT REAL

This indicates the scalar constraint index $i \in \mathcal{I}$, the PSD variable index $j \in \mathcal{J}^{PSD}$, the row index, the column index and the coefficient value. The number of lines should match the number stated in the header.

ACOORD

Description: Input sparse coordinates (triplets) to define the scalars, a_{ij} , as used in the scalar constraints.

HEADER: One line formatted as:

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as:

INT INT REAL

This indicates the scalar constraint index $i \in \mathcal{I}$, the scalar variable index $j \in \mathcal{J}$ and the coefficient value. The number of lines should match the number stated in the header.

BCOORD

Description: Input sparse coordinates (pairs) to define the scalars, b_i , as used in the scalar constraints.

HEADER: One line formatted as:

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as:

INT REAL

This indicates the scalar constraint index $i \in \mathcal{I}$ and the coefficient value. The number of lines should match the number stated in the header.

HCOORD

Description: Input sparse coordinates (quintuplets) to define the symmetric matrices, H_{ij} , as used in the PSD constraints.

HEADER: One line formatted as:

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as

INT INT INT INT REAL

This indicates the PSD constraint index $i \in \mathcal{I}^{PSD}$, the scalar variable index $j \in \mathcal{J}$, the row index, the column index and the coefficient value. The number of lines should match the number stated in the header.

DCOORD

Description: Input sparse coordinates (quadruplets) to define the symmetric matrices, D_i , as used in the PSD constraints.

HEADER: One line formatted as

INT

This is the number of coordinates to be specified.

BODY: A list of lines formatted as:

INT INT INT REAL

This indicates the PSD constraint index $i \in \mathcal{I}^{PSD}$, the row index, the column index and the coefficient value. The number of lines should match the number stated in the header.

CHANGE

Start of a new instance specification based on changes to the previous. Can be interpreted as the end of file when the hotstart-sequence is unsupported or undesired.

BODY: None

Header: None

17.4.5 CBF Format Examples

Minimal Working Example

The conic optimization problem (17.6), has three variables in a quadratic cone - first one is integer - and an affine expression in domain 0 (equality constraint).

$$\begin{aligned} & \text{minimize} && 5.1 x_0 \\ & \text{subject to} && 6.2 x_1 + 7.3 x_2 - 8.4 \in \{0\} \\ & && x \in \mathcal{Q}^3, x_0 \in \mathbb{Z}. \end{aligned} \tag{17.6}$$

Its formulation in the Conic Benchmark Format begins with the version of the CBF format used, to safeguard against later revisions.

```
VER
1
```

Next follows the problem structure, consisting of the objective sense, the number and domain of variables, the indices of integer variables, and the number and domain of scalar-valued affine expressions (i.e., the equality constraint).

```
OBJSENSE

ACOORD
2
0 1 6.2
0 2 7.3

BCOORD
1
0 -8.4
```

This concludes the example.

Mixing Linear, Second-order and Semidefinite Cones

The conic optimization problem (17.7), has a semidefinite cone, a quadratic cone over unordered subindices, and two equality constraints.

$$\begin{aligned}
 & \text{minimize} && \left\langle \begin{bmatrix} 2 & 1 & 0 \\ 1 & 2 & 1 \\ 0 & 1 & 2 \end{bmatrix}, X_1 \right\rangle + x_1 \\
 & \text{subject to} && \left\langle \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, X_1 \right\rangle + x_1 &= 1.0, \\
 & && \left\langle \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}, X_1 \right\rangle + x_0 + x_2 &= 0.5, \\
 & && x_1 \geq \sqrt{x_0^2 + x_2^2}, \\
 & && X_1 \succeq \mathbf{0}.
 \end{aligned} \tag{17.7}$$

The equality constraints are easily rewritten to the conic form, $(g_0, g_1) \in \{0\}^2$, by moving constants such that the right-hand-side becomes zero. The quadratic cone does not fit under the `VAR` keyword in this variable permutation. Instead, it takes a scalar constraint $(g_2, g_3, g_4) = (x_1, x_0, x_2) \in \mathcal{Q}^3$, with scalar variables constructed as $(x_0, x_1, x_2) \in \mathbb{R}^3$. Its formulation in the CBF format is reported in the following list

```

Mixing Semidefinite Variables and Linear Matrix Inequalities

The standard forms in semidefinite optimization are usually based either on semidefinite variables or linear matrix inequalities. In the CBF format, both forms are supported and can even be mixed as shown in.

$$\begin{aligned}
 & \text{minimize} && \left\langle \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, X_1 \right\rangle + x_1 + x_2 + 1 \\
 & \text{subject to} && \left\langle \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, X_1 \right\rangle - x_1 - x_2 \geq 0.0, \\
 & && x_1 \begin{bmatrix} 0 & 1 \\ 1 & 3 \end{bmatrix} + x_2 \begin{bmatrix} 3 & 1 \\ 1 & 0 \end{bmatrix} - \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \succeq \mathbf{0}, \\
 & && X_1 \succeq \mathbf{0}.
 \end{aligned} \tag{17.8}$$

Its formulation in the CBF format is written in what follows

```

Optimization Over a Sequence of Objectives

The linear optimization problem (17.9), is defined for a sequence of objectives such that hotstarting from one to the next might be advantages.

$$\begin{aligned}
 & \text{maximize}_k && g_k^{obj} \\
 & \text{subject to} && 50x_0 + 31 \leq 250, \\
 & && 3x_0 - 2x_1 \geq -4, \\
 & && x \in \mathbb{R}_+^2,
 \end{aligned} \tag{17.9}$$

given,

1. $g_0^{obj} = x_0 + 0.64x_1$.
2. $g_1^{obj} = 1.11x_0 + 0.76x_1$.
3. $g_2^{obj} = 1.11x_0 + 0.85x_1$.

Its formulation in the CBF format is reported in [Listing 17.5](#).

17.5 The XML (OSiL) Format

MOSEK can write data in the standard OSiL xml format. For a definition of the OSiL format please see <http://www.optimizationservices.org/>.

Only linear constraints (possibly with integer variables) are supported. By default output files with the extension `.xml` are written in the OSiL format.

The parameter `MSK_IPAR_WRITE_XML_MODE` controls if the linear coefficients in the A matrix are written in row or column order.

17.6 The Task Format

The Task format is **MOSEK**'s native binary format. It contains a complete image of a **MOSEK** task, i.e.

- Problem data: Linear, conic quadratic, semidefinite and quadratic data
- Problem item names: Variable names, constraints names, cone names etc.
- Parameter settings
- Solutions

There are a few things to be aware of:

- The task format *does not* support General Convex problems since these are defined by arbitrary user-defined functions.
- Status of a solution read from a file will *always* be unknown.

The format is based on the *TAR* (USTar) file format. This means that the individual pieces of data in a `.task` file can be examined by unpacking it as a *TAR* file. Please note that the inverse may not work: Creating a file using *TAR* will most probably not create a valid **MOSEK** Task file since the order of the entries is important.

17.7 The JSON Format

MOSEK provides the possibility to read/write problems in valid JSON format.

JSON (JavaScript Object Notation) is a lightweight data-interchange format. It is easy for humans to read and write. It is easy for machines to parse and generate. It is based on a subset of the JavaScript Programming Language, Standard ECMA-262 3rd Edition - December 1999. JSON is a text format that is completely language independent but uses conventions that are familiar to programmers of the C-family of languages, including C, C++, C#, Java, JavaScript, Perl, Python, and many others. These properties make JSON an ideal data-interchange language.

The official JSON website <http://www.json.org> provides plenty of information along with the format definition.

MOSEK defines two JSON-like formats:

- *jtask*
- *jsol*

Warning: Despite being text-based human-readable formats, *jtask* and *jsol* files will include no indentation and no new-lines, in order to keep the files as compact as possible. We therefore strongly advise to use JSON viewer tools to inspect *jtask* and *jsol* files.

17.7.1 *jtask* format

It stores a problem instance. The *jtask* format contains the same information as a *task format*.

You can read and write *jtask* files using *task.readdata* and *task.writedata* specifying the extension *.jtask*.

Even though a *jtask* file is human-readable, we do not recommend users to create it by hand, but to rely on MOSEK.

17.7.2 *jsol* format

It stores a problem solution. The *jsol* format contains all solutions and information items.

You can write a *jsol* file using *task.writejsonsol*. You **can not** read a *jsol* file into MOSEK.

17.7.3 A *jtask* example

In Listing 17.6 we present a file in the *jtask* format that corresponds to the sample problem from `lo1.lp`. The listing has been formatted for readability.

Listing 17.6: A formatted *jtask* file for the `lo1.lp` example.

17.8 The Solution File Format

MOSEK provides several solution files depending on the problem type and the optimizer used:

- *basis solution file* (extension `.bas`) if the problem is optimized using the simplex optimizer or basis identification is performed,
- *interior solution file* (extension `.sol`) if a problem is optimized using the interior-point optimizer and no basis identification is required,
- *integer solution file* (extension `.int`) if the problem contains integer constrained variables.

All solution files have the format:

NAME	:	<problem name>					
PROBLEM STATUS	:	<status of the problem>					
SOLUTION STATUS	:	<status of the solution>					
OBJECTIVE NAME	:	<name of the objective function>					
PRIMAL OBJECTIVE	:	<primal objective value corresponding to the solution>					
DUAL OBJECTIVE	:	<dual objective value corresponding to the solution>					
CONSTRAINTS							
INDEX	NAME	AT	ACTIVITY	LOWER LIMIT	UPPER LIMIT	DUAL LOWER	DUAL UPPER
?	<name>	??	<a value>	<a value>	<a value>	<a value>	<a value>
VARIABLES							
INDEX	NAME	AT	ACTIVITY	LOWER LIMIT	UPPER LIMIT	DUAL LOWER	DUAL UPPER
↔DUAL							CONIC
?	<name>	??	<a value>	<a value>	<a value>	<a value>	<a value>

In the example the fields ? and <> will be filled with problem and solution specific information. As can be observed a solution report consists of three sections, i.e.

- **HEADER** In this section, first the name of the problem is listed and afterwards the problem and solution status are shown. Next the primal and dual objective values are displayed.
- **CONSTRAINTS** For each constraint i of the form

$$l_i^c \leq \sum_{j=1}^n a_{ij}x_j \leq u_i^c, \quad (17.10)$$

the following information is listed:

- **INDEX**: A sequential index assigned to the constraint by **MOSEK**
- **NAME**: The name of the constraint assigned by the user.
- **AT**: The status of the constraint. In Table 17.4 the possible values of the status keys and their interpretation are shown.

Table 17.4: Status keys.

Status key	Interpretation
UN	Unknown status
BS	Is basic
SB	Is superbasic
LL	Is at the lower limit (bound)
UL	Is at the upper limit (bound)
EQ	Lower limit is identical to upper limit
**	Is infeasible i.e. the lower limit is greater than the upper limit.

- **ACTIVITY**: the quantity $\sum_{j=1}^n a_{ij}x_j^*$, where x^* is the value of the primal solution.
- **LOWER LIMIT**: the quantity l_i^c (see (17.10).)
- **UPPER LIMIT**: the quantity u_i^c (see (17.10).)

- DUAL LOWER: the dual multiplier corresponding to the lower limit on the constraint.
- DUAL UPPER: the dual multiplier corresponding to the upper limit on the constraint.
- VARIABLES The last section of the solution report lists information about the variables. This information has a similar interpretation as for the constraints. However, the column with the header CONIC DUAL is included for problems having one or more conic constraints. This column shows the dual variables corresponding to the conic constraints.

Example: `lo1.sol`

In [Listing 17.7](#) we show the solution file for the `lo1.opf` problem.

Listing 17.7: An example of `.sol` file.

```

INTERFACE CHANGES

The section show interface-specific changes to the **MOSEK** Optimizer API for C in version 8. See the [release notes](#) for general changes and new features of the **MOSEK** Optimization Suite.

18.1 Functions

Added

Changed

Removed

- `MSK_getglbdlname`
- `MSK_init`
- `MSK_putdllpath`
- `MSK_putkeepdlls`
- `MSK_strdupdbgenenv`
- `MSK_strdupenv`
- `MSK_getdbi`
- `MSK_getdcni`
- `MSK_getdeqi`
- `MSK_getinti`
- `MSK_getnumqconknz64`
- `MSK_getpbi`
- `MSK_getpcni`
- `MSK_getpeqi`
- `MSK_getqobj64`
- `MSK_getsolutioninf`
- `MSK_getvarbranchdir`
- `MSK_getvarbranchorder`
- `MSK_getvarbranchpri`
- `MSK_optimizeconcurrent`
- `MSK_putvarbranchorder`

- `MSK_readbranchpriorities`
- `MSK_relaxprimal`
- `MSK_writebranchpriorities`

18.2 Parameters

Added

- `MSK_DPAR_DATA_SYM_MAT_TOL`
- `MSK_DPAR_DATA_SYM_MAT_TOL_HUGE`
- `MSK_DPAR_DATA_SYM_MAT_TOL_LARGE`
- `MSK_DPAR_INTPNT_QO_TOL_DFEAS`
- `MSK_DPAR_INTPNT_QO_TOL_INFEAS`
- `MSK_DPAR_INTPNT_QO_TOL_MU_RED`
- `MSK_DPAR_INTPNT_QO_TOL_NEAR_REL`
- `MSK_DPAR_INTPNT_QO_TOL_PFEAS`
- `MSK_DPAR_INTPNT_QO_TOL_REL_GAP`
- `MSK_DPAR_SEMIDEFINITE_TOL_APPROX`
- `MSK_IPAR_INTPNT_MULTI_THREAD`
- `MSK_IPAR_LICENSE_TRH_EXPIRY_WRN`
- `MSK_IPAR_LOG_ANA_PRO`
- `MSK_IPAR_MIO_CUT_CLIQUE`
- `MSK_IPAR_MIO_CUT_GMI`
- `MSK_IPAR_MIO_CUT_IMPLIED_BOUND`
- `MSK_IPAR_MIO_CUT_KNAPSACK_COVER`
- `MSK_IPAR_MIO_CUT_SELECTION_LEVEL`
- `MSK_IPAR_MIO_PERSPECTIVE_REFORMULATE`
- `MSK_IPAR_MIO_ROOT_REPEAT_PREOLVE_LEVEL`
- `MSK_IPAR_MIO_VB_DETECTION_LEVEL`
- `MSK_IPAR_PREOLVE_ELIMINATOR_MAX_FILL`

Removed

- `MSK_DPAR_FEASREPAIR_TOL`
- `MSK_DPAR_MIO_HEURISTIC_TIME`
- `MSK_DPAR_MIO_MAX_TIME_APRX_OPT`
